"Some two months ago I took delivery of a big single and sidecar with all-chain drive and Sturmey gear box. The engine is delightful and seems to run perfectly at all times when it is in neutral—dead slow, or speeded up, or when doing any work; but immediately I run light, or the outfit drives the engine, a most objectionable rumble commences, which seems at times to tend to pull the machine up, and at other times it causes a distinct vibration.

"I rode up to the makers, whose tester, after a short ride, said the noise was not in the engine but in the gear box. I went to the Sturmey-Archer Co., and, without a moment's hesitation, they fitted a new 'inside.' The noise, however, continues.

"The piston, rings, cylinder, and big and little ends seem perfect, and all the chains are well cared for and at proper tension. I put it down to a loose bearing in the timing case, so took that down, but all the bearings were well oiled, and as firm as thieves. I have not very much time available for working on the machine, and do not want to have to take the whole engine down to examine the main bearings. Filling the gear box with oil and flooding the engine with it makes no difference.

"Considering the care with which these particular engines are built up, run, taken down, examined, and rebuilt, I cannot think that either of the main bearings is loose in its housing. I have been riding many years, and have ridden and examined most of the best English makes, and have had many cases of revolving and dry bearings, but the noise has always been somewhat higher in pitch than this deep rumbling. I cannot 'feel' the fault anywhere.

"The Ferodo inset clutch does not slip."

TESTING A VALVE.

VALVES are very vital components in the motor cycle engine, and although valve breakages are rarer nowadays than in the past, these occurrences are by no means unknown. With o.h.v. engines the consequences are usually serious.

Several factors go to make a really good valve; the mere fact that it is made of "stainless steel" does not ensure, as some people fondly imagine, that it will be thoroughly successful. The heat treatment of the metal must be right, the design must be right, and the workmanship must be flawlessly accurate.

These considerations were all kept in mind when Messrs. Pattison and Hobourn, Ltd., of Shakleton Road Works, Coventry, decided to market a valve that could be guaranteed indefinitely, and an examination and "test" of a P.H. valve seems to indicate that they have attained their objective.

We quote the word "test" because, of all the many and varied accessories *The Motor Cycle* has officially tested, an unbreakable valve is assuredly the most difficult of which to form a true and reliable opinion. This particular valve was fitted to the exhaust of a staff 4 h.p. Triumph, which once during its career had broken a standard valve. The consequent

replacement, however, was still almost as new after another 3,000 miles; and, therefore, after a further 4,000 miles with the P.H., it would be unfair to infer that the latter is superior to the Triumph standard article.

It is certainly as good, however, both in workmanship and "life," as the best standard valve, and considerably more satisfactory than the valves on another staff machine of the same make, which on two occasions stretched about $\frac{3}{4}$ in. after 3,000 miles' running.

Briefly, then, its virtues are negative ones, i.e., it is still as new after a strenuous 4,000 miles, and there seems no reason why it should not last out the life of the engine without much attention (it has had none so far).

Much more conclusive proof of its virtues is supplied by the fact that it was used, so we are informed, in the racing Triumphs this year, and also in the Crouch car which has been meeting with such success at Brooklands in the hands of J. Cocker.

Two models of the P.H. valve, one for ordinary touring and the other for track use, can be supplied to fit any make of motor cycle.

A HALF-DAY WITH THE CUMBRIAN HILL MEN.

Sporting Freak Hill-climb of the Cumberland M.C.C. Successful Lightweights.

A large number of spectators watched the sport on Old Garth Hill. R. L. Williamson makes a good climb on his 4 h.p. Norton.

Nearing the summit: F. R. Anderson, who, on a 2½ h.p. A.J.S., made a successful ascent.

THE enthusiasm of the members of the Cumberland M.C.C. must be almost unsurpassed anywhere.

They are favoured in having the most beautiful bit of Britain for their playground, and there is scarcely a mountain height in all Lakeland that has not echoed with the hum of their engines. Nearly a fortnight ago the final rally of the year was organised by the Western Section, and over two hundred members and friends gathered at the famous Castle Inn, just north of Bassenthwaite Water and in full view of grand old Skiddaw, clothed in all the purple and golden glory of a perfect autumn.

Eagerness for First Honours.

Far aloft snowy summits were first harbingers of oncoming winter, and the keen nip in the air made one thankful that the run was to be a short one. Everybody was anxious to have first shot at the hill of the day. This was the old pack-horse way up Whinlatter Pass from near Thornthwaite. Its existence as a splendid test hill was first mentioned in *The Motor Cycle*, following the earliest sidecar ascent, which was made in the autumn of 1919 by Mary Riley on an 8 h.p. Enfield. The main features of the Old Garth Hill were its length of three-quarters of a mile and a lower grassy hairpin, followed by a long, steady curly climb over rough surfaces on gradients of 1 in 4 and 1 in 5. There

were morasses at the finish on the new road, but few got thus far.

After the deluge of the previous day the grassy parts of the hill were in very bad condition. The "racers" achieved little advantage, for traffic was quickly blocked on the first corner. Then the serious work of the day began. The crowds of spectators realised by painful experience that it was wiser to give the riders more elbow room. It was a fine experience to stand higher up the hill, with shapely Skiddaw towering snow-capped across the vale, and down through the gloom of underlying larches spy the hill-climbers dart one by one upon the opposing gradient. Many failed quite low down through choosing the turfy surface in preference to the stony way. Considering the very "sporting state" of the hill, the successes were astonishing.

Notable Sidecar Ascents.

One of the earliest solo machines to make a clean ascent was the 4 h.p. Norton, ably ridden by R. L. Williamson, the vice-captain of the Cumberland club. The first sidecar up was a 4 h.p. Triumph, driven by J. Pape, of Wigton. The passenger spent little time in the sidecar. A notable feature of the day was the very steady and quiet climb made by Jack Bennett, the treasurer of the club, on a 3½ h.p. Sunbeam. Perhaps the star performance, however, was that of J. Tiffen on a small 2½ h.p. Velocette and

sidecar. Success was achieved at the first attempt, but during a later ascent Master W. F. Tiffen, in the sidecar, was surprised to see his father flung off on to the hillside. The little fellow amused the spectators by shouting "Hurry up, daddy, she's getting-away!"

British Singles to the Fore.

The scarcity of American machines was as noticeable as the preponderance of 4 h.p. Triumphs. All the latter did splendidly, and those ridden by J. Peak, E. J. and A. Marley, J. Tweddle, J. M. Renny, and S. Ridge, were especially prominent. The two last-named each made five ascents, and like several others gave the spectators stirring times. Yet no one was damaged in the slightest by the plunging and bouncing machines. Much interest was shown in the perfect way H. Leslie Edmondson upheld his reputation and that of his 2½ h.p. Coulson B. Probably his machine had the highest gear of all, 11 to 1, and the performance was speedy as well as spectacular. His brother John Edmondson stuck well to the 2½ h.p. A.J.S., and on the upper part arrived speedily. The only other A.J.S. to achieve success was cleverly piloted by F. R. Anderson, and F. O. Huntrods on the 4 h.p. Norton showed that experience counts on the worst of hills. The end of a perfect sporting day was spent in jovial company at Castle Inn.

A Famous Scottish Hill and Rendezvous for Glasgow Riders

THERE are few motor cyclists in Scotland who do not know the hill, Rest and be Thankful, either by hearsay or by bitter experience. There are many in England who know it as one of the toughest, trickiest, and yet most alluring hills in the British Isles, whether as an obstacle to uninterrupted touring or as a duly marked, checked, and beflagged test gradient. Gradients of 1 in 7 and 1 in 10 and a hair-pin at the end of a three miles climb ought to make the reputation of any hill.

But the true peculiarity of the "Rest" is that it is not a freak hill, to which aspirants in motor mountaineering travel far, but a feature of a main road. It lies on the direct route from Glasgow to Oban; unless you care to dodge round less interesting country by way of Tyndrum and Dalnally, you must take the road through Glen Croe. It is a five mile climb from the shores of Loch Long to the stone on the summit (erected by military engineers) which bids the traveller "Rest and be Thankful," and from which, again, the road falls down towards Loch Fyne. A hard climb, a thorough test of man and mount—but very good fun

In Two Instalments.

That long climb is an epic in two instalments. The motor cyclist is first called upon to face, not far from the mouth of the glen, what is known affectionately as "the wee Rest." It is an awkward bit of hill. A left-hand turn leads on to a quarter of a mile of the world tilted at a gradient of 1 in 10, and there are some who fear it more than they do the cleaner "blind" up "the big Rest." Then, a mile further on, comes the real, the true hill. It sneers at you from a 1 in 7 eminence, lets your gasping machine recover on about 1 in 10, tortures you again with another stout spell of 1 in 7, eases off round a left-hand corner to 1 in 15, and completes the process with a nasty hairpin, fatal to him who would take it fast. This practical joke of Nature's is three and a half miles long.

So it is plain that if the Glen Croe road were not a main artery, the motor cycling enthusiasts of Scotland would yet be attracted to it, particularly since it lies within easy distance—forty miles to be precise—of Glasgow. And now that motor cycling is the sport of one half of Britain's youth and the dream of the other

half, Rest and be Thankful, at any summer week-end, is a sight for the gods of the pastime. It is a sight when tests are being held and all the stars are there to twinkle up the hill at fifty-seven to the hour. But it is better when the amateur riders on their standard machines struggle up and, being up, look down critically on those who follow.

Free Entertainment.

Every yard of the long climb is visible from the summit, which is a sort of gallery to the amphitheatre of the Glen. A four-horse sidecar becomes visible as a moving speck, far below. The driver rushes gamely at the first 1 in 7 slope.

"He's sticking!" gasps the man who got up on a two-stroke.

"Not a bit! Not a bit of it!" another cries.

The click and subsequent purr of changed gears comes reassuringly from below. Another blind at another 1 in 7 section—

"He's sticking!" crows two-stroke.

"Wait a second," says another tensely.

If he is not sticking, he is not exactly flying. He creeps over the bridge—faces another hill—falters—recovers—splutters—tickles his carburettor—heaves forward—his passenger scrambles to the carrier—he jerks round the left-hand bend on to the easier 1 in 15—greatly relieved, the engine sings cheerfully. Shortly the 4 h.p. outfit is with us on the top.

"Took it like a fairy," says the rider, waving a proud hand towards his machine. He joins us in criticising the efforts of a seven-nine or a very worried light car. So it goes on till late afternoon, when, at last, we trolley off homewards, convinced that our own performances were the best of the day.

In point of strict fact, Rest and be Thankful presents very little difficulty to the modern machine, decently driven. The writer surmounted it recently on a fixed gear mount of dubious ancestry. But all the fun of motor cycling is in the driving, and all the technique of driving—the essentials, the errors, the excellences, the idiocies, and the ideals—are seen at their best or worst on a long and stubborn slope. That, with magnificent scenery thrown in, is why Rest and be Thankful is such an interesting hill. G.R.B.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

WHICH IS THE WORLD'S BEST SOLO MACHINE?

Sir,—Noticing the amount of discussion as to the world's finest motor cycle, I have ventured to offer my opinion. I think that it is only natural that every nation should claim this title, and that it is a little narrow-minded to confine opinions to British machines alone. Why not take into consideration a few Continental and American machines? Also I consider that each machine has its purpose, either racing or touring. In my mind, the one great objection to a big single is the noise that it is liable to make.

A. M. LEITCH.

[Opinions were not confined to machines of any particular nationality, although the majority of letters received specified British makes.—Ed.]

Sir,—My only excuse for intervention in this correspondence, seeing that I seldom ride solo, is to express my entire concurrence with Mr. Norman Williams in his advocacy of the machine of even torque, but to dissent from his classification of the F.N. and Henderson as "complicated." In point of fact, both machines are delightfully simple; they are also simply delightful to drive. The Scott is no whit behind them either in distinctive merits, and I look with interest for the Stanger and Superb Four.

It would be difficult to ascertain the most popular machine in the world; it would be quite certain that that machine would not be the best, otherwise the goal of progress were well-nigh attained!

But it is easy for me (and others) to say what machines we like best, and I would make my choice every time from the small group that provide an engine with car-like torque.

Newbury.

HENDERSON RIDER.

Sir,—I thoroughly agree with the opinion of "Tyke" as to the Scott being the best solo machine. Having ridden two machines of this make, one a pre-war model, I have yet to experience a serious mechanical breakdown of any kind, and the even pull of the twin two-stroke is a joy to experience, to say nothing of the remarkably long life of the chains and tyres, and almost silent hum of the exhaust.

It is possible to set the throttle lever in one position, and leave the machine to negotiate all hills and corners on the road without once touching this or the gear lever.

Another point, not mentioned by "Tyke," is the really excellent mudguarding on the machine.

It is astounding what gradients the Scott will negotiate on top gear (4½ to 1) without complaint from the engine, and only on hills of the most vile surface or dangerous corners is it necessary to have recourse to the low gear. I live in a hilly district, which abounds in freak hills, and have yet to find the machine which equals the Scott in taking one anywhere in absolute comfort.

GREAT SCOTT.

Harrogate.

Sir,—I have read with interest letters from brother motor cyclists and their opinions as to the best motor cycle on the road. I do not think anyone can really say that this or that machine is the best on the road. No individual motor cyclist can speak for the whole community of motor cyclists.

A cigar, be it a threepenny one or a half-crown one, if the smoker likes it, is a good cigar; if he does not like it, then it is a bad cigar, so far as he personally is concerned.

The same, I think, applies to a motor cycle. I have had many; with one exception, they have all been good. I now have a 3½ h.p. Rover solo. I have never had a better

machine: it is most comfortable to ride, most reliable, goes anywhere and everywhere, climbs anything. I could not get better service, I imagine, from any other make, but I cannot say, or at least I do not say, that it is the best machine on the road. It suits me, and I am very fond of the 'bus, which is a 1920 model. It answers to my every whim, and in return I look after it as though it were a favourite child. I have just given it a new set of F.R.S. lamps and a Terry saddle. The latter article is certainly the most comfortable saddle I have had; it is a wonderful invention. My last ride on it was 160 miles in just over seven hours.

Kingsdown.

MAJOR.

Sir,—I venture to suggest that, in my opinion, an ideal machine can never be one with a rigid frame. Doubtless many of your readers have never ridden anything else, and are more or less content; but I think it would be a very pleasing and eye-opening experience if they took, say, a 200-mile run on a spring-frame machine. On a long run, comfort is everything to the rider, especially under present road conditions.

The next point on an ideal machine should be accessibility to the engine and other working parts, and chains, etc., should be enclosed as much as possible.

For a solo mount, the Raleigh 5-6 h.p. spring-frame is ideal, and as near perfect as present-day experience can give.

For speed, power, hill-climbing, smooth running, cleanliness, and comfort, etc., I know of no other reliable machine on the market to compare.

Unfortunately, I am not the proud owner of one of these machines, but I have ridden some 3,000 miles this year on one, and I must say that it is everything that is ideal and unexcelled in any way, and as soon as I am able to afford a new mount, mine is a Raleigh. The usual disclaimer.

London, S.E.

READER.

Sir,—I make no excuse for again butting into this discussion, which threatens to become a rather aimless eulogy of every machine on the market.

"Tyke's" letter, in the issue of October 20th, somewhat amuses me, particularly his closing statement: "These qualities outweigh the little extra attentions which these machines occasionally demand."

The "qualities," which I am not going to dispute, are (1) easy steering, (2) comfort, and (3) controllability. Now, to an entire novice, "Tyke's" Scott admittedly excels my Triumph in these points; but after a thousand or two miles road experience these two machines become equally satisfactory to their respective riders in both controllability and comfort.

One soon gets used to a machine, and that machine then becomes comfortable and controllable as a matter of course.

But one cannot get used to "little extra attentions"!

I am rather careful of my finger nails and dislike dirty hands; that is why (and I have ridden 75% of the machines mentioned so far in this controversy) I will buy another Triumph next year.

Coventry.

—UMPH.

[We have received so many letters on this subject that we are able to include only a small selection this week. The letters which have been held over mention the Norton twice (particularly eulogising the courteous service of the makers), the Indian Scout twice (on account of its sweet running and flexible engine, large tyres, and handsome appearance), the Scott, the 2½ h.p. Douglas, and the 4 h.p. Triumph.—Ed.]

WHY DOES AN ENGINE ACCELERATE?

Sir,—The problem propounded by "Ixion" as to why an engine accelerates when the throttle is opened is one that must have puzzled most motor cyclists. Doubtless, some of your technical correspondents can give a convincing explanation. As an amateur I have often thought over the matter, and I have come to the conclusion that most of us tackle the problem from the wrong end. The matter is simplified by considering the meaning underlying the word "throttle." In common parlance, to "throttle" anything is to "get it by the throat." This affords a clue to its engineering application. It must be obvious that a petrol engine, unlike a lazy horse, needs no whipping to cause it to accelerate. From the moment it fires its every tendency is to increase its revolutions. Given unlimited access to the carburettor, it would reach its maximum in no time. Some method is necessary to check this tendency, and a throttle slide serves the purpose. To revert to the engine analogy, the engine is like a spirited horse wanting to be off. The throttle slide is the controlling rein. This explanation disposes of "Ixion's" second query, "What single factor produces the initial acceleration when the throttle is first opened wider?" The opening of the throttle merely allows the engine more rein to run.

So far so good; but I confess that while I can see some part of the reason for an engine's acceleration, I cannot see all of it. If water is pouring through a sluice and the sluice is partly closed less water goes through. But there can be no parallel between a sluice and a throttle slide, for the latter has no pressure of gas behind it. How, then, does the slide operate? When the engine sucks, it is supposed to fill the cylinder whether the opening it sucks through is small or large. But does it suck its fill, or is it always hungry for more? Judging from its behaviour when the throttle is opened wider it is in a constant state of starvation. Yet the jet and air openings remain unaltered, and the mixture is the same. The only conclusion is that the throttle slide does not allow the engine to suck all the gas it requires; hence its restricted "revs."

This opens up the whole subject of gas supply, and it would be interesting to have further information on this point. What happens when an engine is supplied with explosive gas from a container like an oxygen cylinder? Can the throttle be abolished and the engine speed be controlled by the container tap? Personally, having conducted a long series of experiments this summer with a variable jet and an extra air valve, I am of the opinion that a vast field of research is still open in this direction. The results are of extreme interest to me, and if deemed of sufficient interest to readers, I should be pleased to supply them. My only fear is that I am traversing ground already well-trodden by the technical experts.

Northampton.

NENE-SIDER.

Sir,—Not having had much experience in driving motor cycles, one hesitates to answer "Ixion's" questions, my only excuse being that I have a degree for engineering, the course of study including heat engines, etc.

The whole phenomena depend on the great speed at which the gases rush into the cylinder. In the case of the $4\frac{1}{2}$ h.p. B.S.A. engine, turning over at 2,000 r.p.m. (corresponding speed of the machine 29 $\frac{1}{2}$ m.p.h.), the average piston speed is 14 $\frac{1}{2}$ m.p.h.

The area of the piston top is nine square inches nearly; so if the area of the inlet pipe between the cylinder and the carburettor is about one square inch, then the speed of the mixture in this pipe during induction must be in the region of $9 \times 14\frac{1}{2} = 130$ m.p.h.!

It is therefore obvious that any obstruction in the carburettor or inlet pipes will seriously affect the flow of gases. Hence the pains taken by speedmen to cut chunks off the cylinder ports wherever necessary.

Now, the engine does take in about the same charge, and a nearly full charge at that, whether the engine is going slowly on small throttle or fast on full throttle, but the point is that an engine—loaded—can only go slowly on small throttle, for if it did speed up by any chance, e.g., a push behind, it would, when the push was ended, slow down again, for at the higher speed on the same throttle opening the cylinder could not get a full charge, due to the shorter time the valve is open.

Now, if the throttle were opened wider, the engine could draw a full charge of gas into its cylinder at the higher speed and smaller time of valve lift.

B8

Consequently, the engine runs up to such a speed that the cylinder just fails to draw in a full charge of gas. That is the stable running position as explained above.

When the throttle is opened up the engine draws a full charge—quite full this time (unless over-heated)—the engine accelerates; the suction on the jet increases, due to the greater velocity of the air in the inlet pipe, giving a richer mixture, so the air lever has to be opened wider.

This gives the well-known result that for two-lever carburettors the air lever has to be freshly adjusted for every position of the throttle.

From this it would appear that the factor governing acceleration is: Size and lack of obstruction in the air supply path from atmosphere to cylinder.

Hence, acceleration will depend on valve diameter, valve lift, design of cylinder ports, etc., as well as jet size.

Lastly, a weak mixture burns more slowly than a correct mixture; hence, combustion may continue until the inlet valve opens, and the new charge of gas, also of slow-burning quality, is ignited. Thus, a state of pre-ignition exists, and knocking ensues.

HONS. B.ENG.

Bootle.

ELIMINATING MECHANICAL NOISE.

Sir,—Can any reader tell us how to reduce the noise from the valve gear of a $3\frac{1}{2}$ h.p. Rudge-Multi? With a silent gearing I am sure Rudge riders could desire no more in the way of a sporting solo machine. Has anyone tried enclosing the overhead valve gear after the M.A.G. style? If so, with what result?

South Norwood.

MULTI GEAR.

ALPINE PASSES.

Sir,—On page 438 of your issue of October 13th appears an illustration of the Stelvio Pass (9,041 feet), with a note that it was climbed before the war on single-gear machines.

If this letter catches the eye of any reader who has climbed the Stelvio it would be interesting to hear his experience.

Old readers of *The Motor Cycle* may recall the name of Mr. Douglas Fawcett. If my memory serves me right, he was a pioneer of Alpine touring on a twin Bat (single-gear).

I should be interested to know whether the Stelvio is more severe than the Galibier (the highest main road in France, 8,550 feet). I have crossed the Galibier in both directions on a single-gear 6 h.p. Matchless-Jap. My companion's mount last year was a Lea-Francis, and this year a Rudge-Multi. We did not attempt non-stop climbs, and I had some assistance from my friend in re-starting, but no serious difficulty was experienced. This year we crossed from the north, climbing to the first tunnel with one stop. (I made a restart unassisted.) We stopped in the Valloire Valley at the foot of the "zigzags," leaving the stream, and once more below the final hairpins. The total rise is 6,201 feet, and the ruling gradient 1 in 10 on the lower portions and 1 in 8 towards the summit.

It is perhaps needless to say that the road is a wonderful piece of engineering—it is a real "surprise" climb on a gigantic scale.

Alpine touring deserves more attention from English riders, many of whom would not miss it if once they tasted its attractions. Can any reader tell me the number of turns on the Col de la Forclaz, between Martigny and the summit?

A. D. DRAPER.

A neat looking three-wheeled runabout designed and built by Mr. J. Jones, Sunderland. The transmission is by friction drive to countershaft, the final drive being a $1\frac{1}{2}$ in. belt. An 8 h.p. air-cooled J.A.P. engine is fitted.

PRIVATE OWNERS' T.T. LAP RECORDS.

Sir,—I read with interest the letter by "Omega," headed "27.32 m.p.h.—A Private Owner's T.T. Lap Record," in your issue of October 20th. I went to the Isle of Man for the first time last June to see the T.T. Races, and took my 'bus, a "Big Four" Norton, across with me. I went for a run round the course on the evening of my arrival, and my time for the lap was 62m., an average speed of just over 36½ m.p.h. I could no doubt improve this time a little after knowledge of the course. Coming down the mountain road at a good "bat," I found Keppel Gate shut, and, as the evening light was failing, I did not notice it until I was quite close. However, I managed to pull up with an inch or two to spare.

Bishop's Castle.

NORTON.

"ISSUED TO MEMBERS"—BUT NOT FREE.

Sir,—I am somewhat surprised to see that, according to a paragraph in the "Sparklets" page of your paper, the A.A. and M.U. handbook is "issued annually to members." I would point out to all those interested that upon applying for one of these I was informed that it would be forwarded to me upon receipt of 5s.

This appears to me to be a somewhat exorbitant charge for a book having a "considerable portion of it devoted to the advantages of membership and the services rendered." Sudbury.

ZENITH, DX 1997.

[Several other letters in the same strain have reached us, although in some cases the charge for the handbook is given as 2s. 6d. Perhaps the A.A. and M.U. will explain.—Ed.]

WHAT IS A STANDARD MACHINE?

Sir,—In reply to "R.A.F." (London), as to what is a standard machine, is he trying to be funny or what? He should know as well as I do that a standard machine is one which anyone may buy, such as the Norton, and which is not made specially for racing. My son and I ride one each, and would not "swap" for any other make at present. They are absolutely standard, and I myself saw Mr. Hassall (that fine Norton rider) do the quarter-mile in 10s. (=90 m.p.h.) on my new 3½ h.p. standard Norton.

Regarding changing handle-bars, plugs, etc., this is mere piffle.

J. H. WILKINSON.

Sir,—It is with great pleasure that I have seen this, to my mind, most important point brought into your correspondence columns, and I do not think it ought to finish in that place, but be brought forward by the A.C.U. into a definite definition and acted upon in all trials that are of any first-class importance, no matter the type—hill-climb, speed event, or reliability trial.

The non-standard machine should be made to compete in a definite "non-standard" class, and if its resultant performance is utilised for advertisement it should be definitely stated as being in that class.

We who are specially interested in organising trials realise perhaps more than anyone else this snag of non-standard machines competing against pure standard ones in the same class, and the difficulties that arise when a rider comes along with a machine that we all know, barring a smash up, will sweep the board, and its effect on entries.

I would therefore suggest that the definition be framed much on the following lines:

That a standard machine for the purpose of competition trial riding, no matter whether the resultant performance is used for advertisement or not, shall be a machine which can be bought direct from the manufacturer or from his duly authorised sales agent, and is listed at a definite price in that manufacturer's sales list, and is available for prompt delivery to the general buyer. Tyres, handle-bars, plugs, and carburetter could be excluded, as each individual has his own pet fancy on these, and would possibly alter to meet the special class of event he was competing in; also gear box, so long as it was the same make as supplied with the machine and the cycle manufacturer gave the option of open or close ratio gears. Also a rider would alter his timing in regard to late or early firing, but no alteration to cams, etc., would be allowable. A different make of magneto would be allowable so long as it was capable of being purchased in the ordinary way. For instance, a rider with a Magdyno for ordinary touring would be permitted to replace this with a C.A.V. or B.T.H. if he were competing in a speed event.

If this rough idea were acted upon and brought into a definite ruling by the A.C.U., I think it would prove of the

greatest interest to the sporting side of the pastime. Such a definition as this would prevent all the special freak machines that now are going about the country in the hands of manufacturers' pet riders sweeping up everything in the prize list, as they would only be able to compete against machines of their own class, and leave the standard class to be won by a standard machine. As an instance, it would place the o.h.v. Blackburne, o.h.v. A.J.S., o.h.v. Sunbeam, and such like special engines and machines, which I as an ordinary buyer could not inspect and buy from an agent's stock, into a class of their own; but immediately they became on the general market they would come into the standard class.

I could enlarge further on this interesting subject, but before doing so await the comments of others interested.

Sheffield.

ROTOM.

SUNDAY COMPETITIONS.

Sir,—As a reader of several years standing, I am taking this opportunity to congratulate you on your firm stand against Sunday trials.

The trouble seems to be that some motor cyclists do not look upon the matter in the right light. Sunday trials, as Sunday trials, are ethically as right as Sunday golf or tennis, as far as Sabbath-breaking is concerned. But neither tennis nor golf affects anyone but the players, whereas with regard to motor cycling the point is this: The "man-in-the-street" has a prejudice against motor cycles. He terms them noisy. Unfortunately enough, he is to a great extent right, for there are barely half a dozen makes that, as usually driven, are comparatively silent, even compared with a cheap car. Now, the "man-in-the-street" is no fool, and he realises that the motor cycle has come to stay; and so, during the week, he endures even speed trials without kicking, and confines himself to reading, with unconcealed pleasure, of the numbers of motor cyclists who have been run in and fined for infringing one or more of the many laws that a paternal Government has appointed for their confusion. But on Sunday, when he hopes for a little rest and quiet, and he hears the exhausts and valve rattle of twenty or thirty motor cycles on some trial, making the day hideous with their uproar, he gets really peeved. And when they continue, on and off, Sunday after Sunday, he is absolutely wild, and makes an outcry at the local town council, and does his best to have all trials, whether Sunday or weekday, prohibited. And he rouses the police, and they become officious, and start to set traps, to inspect licences, and to make themselves generally unpleasant.

Now, it is as hard to make the average Englishman part with a prejudice as it is to make the average Scot part with sixpence. Yet motor cyclists, as a class, seem to be making no effort to remove this prejudice against themselves; and a section, luckily small, seems to take a delight in strengthening it. Those who advocate and participate in Sunday trials should remember that they are enjoying themselves at the expense and to the discomfort of a large portion of that community in which they form so small a portion. Such behaviour, tending to bring the whole motor cycling fraternity into disrepute, is not sport; it becomes mere selfishness, and is justly condemned by all right-thinking motor cyclists.

Seacroft.

SAMUEL ST. JOHN.

A WELL-
PROTECTED
SOLO
MOUNT.

A French reader, M. A. Gustave Merlin, sends this photograph of his Indian motor cycle, showing how very thoroughly he has studied the problem of weather protection.

"AN EXTRA 20 M.P.G."—WITH EASE.

Sir,—I notice in a recent number of *The Autocar* that a correspondent obtains as high as 90 m.p.g. on a 1909 8 h.p. Rover car. By means of "fine steel wire up the jet" he manages to obtain this remarkable petrol consumption. When this attachment was fitted to a Triumph motor cycle jet an extra 20 m.p.g. without decreasing power was obtained.

As there are doubtless many like myself who have never before heard of this "economiser," it would be a favour if you could give publication to this letter, so that a full description may be obtained.

SK 696.

Wick.

COSTS OF SPARES AND COMPONENTS.

Sir,—It may interest some of your readers to know that if they buy Villiers parts at the prices advertised in *The Motor Cycle* they can build an engine within a very few shillings of the price quoted by Messrs. Villiers for a complete engine. This is as it should be.

L.A.P.

Norfolk.

Sir,—It is to be regretted that your correspondent "Pourquoi" cannot differentiate clearly between the consequent average higher price, which must be placed on all spare parts, due to the fact that there may be no call for a large number of items (which therefore subsequently become scrap), and the remanufacture of other parts for which the demand has been larger than was originally foreseen, and the production of which must be put in hand piecemeal from time to time, over a number of years, in consequently diminishing quantities. These two conditions are entirely independent, though concurrent.

I am sorry also that your correspondent translates my remarks respecting competition between makes in its narrowest sense.

In the first place, it should be well known that there are quite a number of standard components which are common to many of the machines on the market.

In the second place, it should hardly be necessary for me to explain that the competition in the sale of motor cycles to-day is exceedingly keen, and that the cost of spare and replacement parts is very often the factor which decides a customer in the choice of his ultimate purchase. Therefore the manufacturer is compelled, through this competition, to keep the cost of his spare and replacement parts as low as possible.

As my letter was written to explain some of the reasons for the alleged high cost of spares, and not as a polemical *tour de force* in subtleties of meaning of words and phrases, I am left cold if "Pourquoi" is unable to see how a bugbear may be cheerfully endured, or that a moral obligation and a recognised duty may be, and often are, one and the same thing.

A. ERNEST GELDER,

Managing Director, F.N. (England), Ltd.

SIDECAR CONNECTIONS.

Sir,—When "Wharfedale's" article on sidecar connections appeared I read it with unusual interest, and noted his general opinion that some kind of flexible connection should be used to reduce, as far as possible, shocks to the bicycle frame and sidecar chassis. I have also followed the subsequent correspondence.

Most motor car engineers ridicule the sidecar as an unmechanical device. It is, however, still with us, and so long as motor cycles are used will, in my opinion, remain as the handiest and lowest priced method of comfortably carrying a passenger, when the motor cyclist becomes tired of journeying alone.

My motor cycling experiences include most forms of sidecars—the so-called rigid type, the Montgomery hinged type (where the bicycle was partly balanced as well as steered), the spring wheel variety, the castor wheel design, the spring controlled steerable wheel, etc.

Suffering about a year ago from aches, brought on by sidecar jolts and fearing the sidecar or cycle connections might break, I provisionally protected a flexible joint or connection for sidecars, which you reviewed in *The Motor Cycle*. These are designed on the lines of the Hardy patent universal joint disc, and since the experimental models were made have been considerably improved. Two sidecars so fitted have been in constant use for about twelve months, and have proved quite successful. These flexible connections give the movement required, but it is only a small amount

of movement, sufficient to absorb road and engine shocks, but not sufficient to interfere with the steering. The joints are situated about midway along the tubular members by which the sidecar frames are attached to bicycles.

Some designers find that one reason of cycle frame breakage is the provision of attachments that do not yield. The provision of lugs built into the frame appears to be a more thorough and neater method than clips, but their extra rigidity sometimes defeats the object desired, because of increased strain transferred to another point. Engine vibration also is sometimes the cause of cycle frame breakage.

My idea is that, as engine vibration and road shocks are almost impossible to eliminate on a low-priced machine like a sidecar outfit, one method to overcome the difficulty is to provide a flexible joint or joints between the cycle and sidecar, which allow a certain degree of elasticity without great complication and increase of manufacturing costs.

When my patent is adopted, the only alteration required is to cut the sidecar tubes and insert the flexible joint by brazing two disc carriers one at each end of the divided tube, and bolting the disc to the carriers.

Practically any degree of flexibility may be obtained by increasing or decreasing the diameter of the disc and number of plies of Hardy fabric.

W. F. GREW.

SUMMARY OF CORRESPONDENCE.

"Enfield" (London, S.W.11) complains that the Motor Licence Department of the L.C.C. demanded a "statutory declaration made before a Commissioner of Oaths" before they would replace a lost licence card.

"Rover" (Oxford) wishes to thank the motorist who towed him into Leighton Buzzard, going three or four miles out of his way to do this.

A Durham correspondent calls attention to the inequality of fines inflicted on motor cyclists in his local police court. Dangerous driving at (according to the Mayor) "the most dangerous corner in the district," apparently costs five times as little as a similar offence at a, presumably, less dangerous spot.

Mr. Charles P. Ibotson states that he was recently fined 10s. at Windsor for insufficient illumination of his rear number plate, caused by dust on his rear lamp. It is worth recollecting that, as reported last week, a case in South Shields, in which the rear plate was entirely obscured, was dismissed on the ground that only one number plate need be illuminated at night.

Referring to a correspondent's reference some time ago to the state of the Liverpool-Ormskirk road, Mr. J. E. Sharrock reports that this road is now in good condition throughout.

"XA 6897" (Ilfracombe) complained of the stone-laying nuisance in Devonshire to the A.C.U., and asked, as he had twice broken his frame on roads under repair, if the county council could be summoned. The reply was in the negative. The Barnstaple-Ilfracombe road *via* Branton is instanced by "XA 6897" as being in particularly vile condition.

Books & Maps for Motor Cyclists.

Issued in conjunction with *The Motor Cycle*.

"MOTOR CYCLES AND HOW TO MANAGE THEM."

The standard handbook on the motor cycle.

Price net, 2/6. By post, 2/10.

"HINTS AND TIPS FOR MOTOR CYCLISTS."

New Edition. Just Published. Price net, 2/- By post, 2/3.

"TRACING MOTOR CYCLE TROUBLES."

A system for tracing motor cycle faults and of remedying them when found. Fourth Edition.

Price net, 2/- By post, 2/3.

"TWO-STROKE MOTOR CYCLES."

A reliable treatise on Two-strokes, from the rider's point of view.

Price net, 3/- By post, 3/3.

"MOTOR CYCLE REMINISCENCES."

By "Ixon," of *The Motor Cycle*.

Price net, 5/- By post, 5/3.

"THE MOTOR CYCLE" ROAD MAPS.

Set of Three Maps—England and Wales, Scotland.

London. Set of three, complete in case. Price net, 5/6.

Book post, 5/10. Set of Two Maps—England and

Wales, London. Price net, 4/6. By post, 4/8.

"THE MOTOR CYCLE" ROUTE BOOK.

With 32 pages of Road Maps. Price net, 5/- By post, 5/4.

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a 2d. stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 2d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

USING A CAR MAGNETO AS A DYNAMO

? (1.) Is it possible to use a four-cylinder magneto for electrically lighting a motor cycle, running for just that purpose from the engine? (2.) If the above is possible, could you tell me where I could get the information as to utilising the magneto for this purpose? —J.C.N.

A four-cylinder magneto, as it stands is not suitable for electric lighting. It would, however, be possible to convert such an instrument into a dynamo, but unless you are competent to deal with electrical apparatus we would advise you not to undertake the experiment.

SPEEDING UP A TOURING MOUNT.

? I have recently taken delivery of a chain-drive Triumph, and should like to get 60 m.p.h. I have been thinking of having a Ricardo slipper piston and an Amac racing carburetter. Is it possible to get over the 60 m.p.h. mark without fitting a lighter piston? Will the fitting of a piston upset the balance of the engine? If unnecessary to alter the present piston, can you give me a few hints as to timing to get the desired result? —J.S.M.

You will have considerable difficulty in obtaining 60 m.p.h. without very considerable modifications. Though quite fast enough for all normal purposes, it is not designed as a high-speed mount, and in normal tune is capable of about 50 m.p.h. If you fit a Ricardo piston the engine will certainly have to be rebalanced.

DAMAGED FLYWHEEL KEY.

? My 1914 two-stroke engine, since overhauling and re-bushing, has sheared five separate flywheel keys. I have tried three in one day, made of the best steel, and it has cut them all clean out. —J.W.

The trouble in the first case was no doubt due to the flywheel being insufficiently locked upon the engine-shaft, and the shearing of the first key has probably damaged either the keyway in the flywheel or the shaft itself. It is possible that the key was standing a little too high in its seating, thus preventing the flywheel bedding properly on to the taper of the shaft. Very few makers of two-stroke outside flywheel engine now fit keys, and your best plan would be to do away with the key in your own engine and to grind the flywheel on to the shaft.

A THANKLESS TASK.

? A short time ago I had a mishap with my 1914 6 h.p. outfit, and the brake rim was bent and broken at the brazing. I have taken it to a repairer, who tried to obtain a new rim from the makers but was unsuccessful. He therefore straightened the rim and re-brazed it, but the result is not altogether satisfactory. Do you think the repairer should make a charge in these circumstances? —J.A.V.

It is extremely difficult to repair the brake or belt drum, and if the work which you had done was unsatisfactory, perhaps the repairer is not altogether to be blamed —apparently he endeavoured to do the best possible, a new rim not being obtainable.

Important Dates.

Fri., Nov. 4th, to Sat., Nov. 12th—
Automobile Exhibition, Olympia and
White City. (See "The Autocar.")

Sat., Nov. 5th—Midland Centre A.C.U.
Open Reliability Trial.

Mon., Nov. 28th, to Sat., Dec. 3rd—
The Olympia Motor Cycle Show.

Sat., Dec. 3rd to Tues., Dec. 13th—
Brussels Show.

Mon., Dec. 26th, Tues., Dec. 27th—
M.C.C. London-Exeter London Trial.

Sat., Dec. 31st.—N.W. London M.C.C.
Twelve Hours Open Win'er Trial.

Fri., Jan. 27th, to Sat., Feb. 4th, 1922—
Scottish Car and Motor Cycle Show.

ASKING TOO MUCH.

? (1.) Could you tell me whether I could fit a lightweight sidecar to my 2½ h.p. flat twin Zenith without racking up the engine? (2.) Could it get up reasonable hills with the aid of the Gradua gear? —R.L.

The 2½ h.p. flat twin Zenith should be capable of propelling a light sidecar under favourable conditions, but as it was not built for such work, it would be advisable to query the manufacturers regarding the strength of the frame for this purpose. It is hardly fair to attach a sidecar of any description to a machine designed purely as a solo mount. The range of the Gradua gear is not very wide, but the ratios should enable you to climb all ordinary main road hills with a sidecar.

TOP GEAR TOO LOW.

? Can you give me a suitable gear ratio for my 4.5 h.p. twin sidecar outfit? At present it is too low with an eighteen tooth sprocket driven to thirty-eight on countershaft. The final drive is by a 6in. belt pulley to a 20in. drum on the back wheel. I propose raising the gear by putting a bigger sprocket on the engine, but I do not know the number of teeth suitable. The present gearing is very low, and makes the engine very hot owing to it racing. —I.S.

The present gear is 7 to 1, and this is much too low. A top gear of 5½ to 1 should be satisfactory, and an engine sprocket with twenty-four teeth will give this approximately. The rule for calculating gear ratios is quite simple, and is as follows: Multiply the diameters or number of teeth of all the driving elements, and similarly multiply the driven elements; divide the former product into the latter to obtain the gear ratio.

NO POWER.

? After running perfectly for three or four miles, my Levis engine tires and then stops, but in a few minutes it can be started, and will run perfectly again for a few more miles, only to "konk out" once more. When this happens the engine is too hot to touch (even though it be blowing a gale), but has no sign of seizure. It has a new Runbaken magneto (fixed ignition), timed 2 mm. before T.D.C. (points just opening), and I have decarbonised the engine and fitted new rings—gaps eight to ten-thousandths respectively top and bottom. Compression is good, and there are no air leaks. When running it will take full air. Petrol consumption seems excessive; jet 24. Have tried 22 unsuccessfully. B.B. top feed carburetter. I have thoroughly cleaned all ports, exhaust pipes, and silencer, and there is no stoppage in petrol pipe, jet, or carburetter. —T.L.

The ignition of your engine is apparently too far retarded. You might try setting the points to break with the piston 6 mm. before top dead centre. This should make a considerable difference to the power and consumption. It is possible also that the type of plugs you are using are not suited to the engine. The makers will inform you which is the most suitable in their experience.

HIGH CONSUMPTION OF TWO-STROKE.

? As far as I can judge, the engine (Villiers) of my $2\frac{1}{2}$ h.p. Overstone seems perfect. The timing is correct, the carburetter all right, the machine starts perfectly, goes well, and is in every way satisfactory, with one exception. I cannot get more than 25 m.p.g. out of it. The machine was only bought new in May of this year. Can you kindly suggest a remedy?—D.N.P.

You should obtain not less than 70 m.p.g. with your machine, but the details you give do not make clear the cause of the trouble. The following points, however, should receive attention: (1.) Reduce the size of the jet as much as possible. If the jet is too small, however, there will be a considerable amount of blow-back through the carburetter, and if this happens the jet size must be increased a little until cured. A variable jet adapter will help you considerably in carburetter tuning. (2.) Reduce the petrol level until there is slightly less than $\frac{1}{16}$ in. play between the split pin on the float chamber needle and the top of the float. (3.) Keep the ignition well advanced. The spark should occur when the piston is on top dead centre with the ignition control fully retarded. (4.) Guard against leaks in the petrol pipe joints, transmission slip, or undue friction.

SUDDEN LOSS OF TUNE.

? During a recent tour round Derbyshire on a $2\frac{1}{4}$ h.p. Enfield, when about five miles from Buxton, the engine stopped in the middle of a long hill, having previously climbed some serious hills without any trouble. The throttle was almost wide open, also the air lever. When I felt the engine stopping I closed down the air and worked the throttle, but without effect. I cleaned the plug and mounted again. The most I could get on second speed was about 12 m.p.h. still on the hill. The engine then began to backfire, loud short explosions, which appeared to come from the carburetter. After each explosion the machine appeared to go slightly quicker and then gather itself for another explosion. I gave plenty of petrol, but without any improvement. Also during this time the back wheel gave a jerk every few yards. On arriving at Buxton I took down the carburetter but found nothing amiss. On the return journey the engine gradually slowed down at the first hill, and I was compelled to change down into first speed. This happened at all the hills for about ten miles, when I began to feel a slight improvement; but I was only getting about half-speed even on the level. On arrival home I found I had used as much petrol on a forty-mile run as I had previously used on eighty miles. On pulling up to dismount I changed into free engine, and with the throttle open about a third and the air lever closed the engine stopped itself after about half a minute.—E.T.

Your trouble would appear to be due to one of two causes. Either the magneto timing has slipped, in which case you should reset the magneto so that the points are just about to break on full retard when the piston is on top dead centre; or you are suffering from pre-ignition due to an

unsuitable plug. It would be worth your while to try another plug before making any further alterations.

CHOOSING A MOUNT.

? Will you please let me know which is the simplest and best machine for light work? Easy starting and handling in traffic are needed, but not high speed.

—G.H.B.

For obvious reasons, we are unable to recommend any particular machine in the way you require. The majority of the lightweight machines on the market at the present time will give you satisfactory service, and are quite capable of performing the work for which they are intended. We would advise you to obtain a copy of "Motor Cycles and How to Manage Them" from our publishers, and to read therein the chapters on choice of machines. You will then be in a better position to select the type which you require.

EXPANDING BRAKE AND CLUTCH LUBRICATION.

? I have an old motor cycle which has a clutch of the type in which a band of phosphor-bronze expands into the steel drum of the belt wheel. Also the rear brake consists of two iron or steel shoes, which expand into a steel drum (after the fashion of the A.J.S. rear brake, which, however, is Ferodo-lined, whereas mine is metal-to-metal). Will you please tell me whether these should be lubricated, and, if so, with what? The machine is a 1911 6-7 h.p. Rex.—J.M.R.

Phosphor-bronze brake or clutch drums do not require a great deal of lubrication, otherwise they tend to slip. Very thin oil, such as that used for pedal cycle bearings, is most suitable. It is possible that the shoes have enough metal in them to allow of turning down sufficiently to permit them being fitted with a modern friction lining, which requires no oiling.

FOUR-STROKING.

? Having experienced some slight running defects in my James two-stroke, I shall be glad if you will put me right on the following: With magneto timed fully retarded, with piston at dead top, my machine misfires on the level, and four-strokes badly down gentle slopes and hills. It is not excessive oiling, as I rarely give it enough to make it smoke. The only time it two-strokes perfectly is uphill (with the ignition anything from fully retard to one-third advance) and on the level with fully retard. The carburetter is an Amac (27 jet), the engine is sound, and there are no air leaks. I might say oiling it, no matter how little, tends to make it worse. The average speed is about 20 m.p.h.—TREBLIG.

We can only think that your methods of driving are at fault, especially as regards the control of the ignition. The magneto should be timed so that the contact breaker points are just separating when the piston is on top dead centre with the magneto control fully retarded. When driving normally, the magneto control should be fully advanced, and it should only be retarded when hill-climbing at very slow speeds. You would find the handbook on "Two-stroke Motor Cycles," published by Iliffe and Sons Ltd. of considerable assistance to you, as it contains information both on the driving and maintenance of all two-stroke machines.

The designer of the Barr and Stroud sleeve valve engine, Mr. A. Douglas S. Barr, on the saddle of an A.J.S. lightweight, fitted with one of these units. (Inset) Showing the engine mounted in a $2\frac{1}{4}$ h.p. A.J.S. frame. The cubic capacity is 350 c.c., the bore and stroke being 70 x 90.5 mm.

RECOMMENDED ROUTES

NEWARK TO KIRKBY OVERBLOW (YORKS.).
—F.T.S.

Tuxford, Retford, Bawtry, Doncaster, Wentbridge, Ferrybridge, Aberford, Wetherby, Spofforth, Harrogate.

WARRINGTON TO BRUTON (SOMERSET).—
C.S.B.

Warrington, Weaverham, Tarporley, Whitchurch, Hodnet, Wellington, Bridgnorth, Kidderminster, Worcester, Tewkesbury, Gloucester, Berkeley Road, Filton, Bristol, Pensford, Binegar, Shepton Mallet, Evercech, Bruton. Approximately 183 miles.

SLOUGH TO WARRINGTON.—C.S.B.

Slough, Farnham Royal, Beaconsfield, High Wycombe, Tetworth, Holton, Hedington, Oxford, Deddington, Banbury, Gaydon, Warwick, Solihull, Birmingham, Sutton, Coldfield, Watling Street (to Holyhead), Cannock, Stafford, Eccleshall, Market Drayton, Audlem, Nantwich, Middlewich, Northwich, Budworth, Warrington.

Bolton, Astley Bridge, Belmont, Withnell, Hoghton, Walton-le-Dale, Preston, Broughton, Garstang, Galgate, Lancaster, Caton, Cloughton, Hornby, Mellings, Tunstall, Casterton, Sedburgh, Kirkby Stephen, Brough, Sowerby, Brough, Bowes, Barnard Castle, Staindrop, Raby Castle, Bishop Auckland, Spennymoor, Durham, Newcastle-on-Tyne, Gosforth, Morpeth, Pegsworth, Ashington. Approximately 161 miles.

PETERBOROUGH TO WIGAN.—J.B.

Peterborough, Alwalton, Elton, Oundle, Benefield, Upper Benefield, Great Weldon, Corby, Wilbarston, Dingley, Market Harborough, Lubenham, Theddingworth, Husbands Bosworth, North Kilworth, Lutterworth, Bitteswell, Ullesthorpe, Claybrooke, High Cross, Atherstone, Fazeley, Weeford, Lichfield, Rugeley, Stone, Woore, Nantwich, Tarporley, Cote Brook, Cuddington, Weaverham, Danesbury, Warrington, Wigan. Approximately 166 miles.

BROMLEY TO TORQUAY.—H.B.W.

Bromley, Bromley South Station, Hayes, Addington, Coombe Lane Station, Waddon Station, Wallington, Carshalton, Sutton, Cheam, Ewell, Epsom, Ashted, Leatherhead, Great Bookham, Effingham, East Molesey, East Clandon, Merrow, Guildford, Hog's Back, Puttenham Corner, Farnham, Alton, Chawton, Alresford, Itchen, Stoke, King's Worthy, Winchester, Hursley, Romsey, Sherfield English, Whiteparish, Salisbury, Wilton, Shaftesbury, Sherborne, Yeovil, Chard, Yarcombe, Honiton, Fenny Bridges, Honiton Clyst, Exeter, Alphington, Kennford, Kingsteignton, Newton Abbot, (edge of) Kingskerswell, Torquay. Approximately 210 miles.

EXPERIENCES WANTED.

Readers' replies to questions published under this heading should be sent to the Editor, "The Motor Cycle," Hertford Street, Coventry, when they will be forwarded direct to the querists concerned.

"J.W.C." (Brentwood).—Disc wheels on 4 h.p. Triumph ridden solo.

"H.C.S." (Mitcham).—Cox-Atmos carburettor on Scott with sidecar.

"V.P." (Longton).—Tamplin: Reliability, durability, upkeep, cornering, tyres, etc., over twelve months.

"G.L.S." (Croydon).—Metro-Tyler: Reliability, climbing, and petrol and oil consumption.

"F.E.D." (Norwich).—8 h.p. Matchless family outfit: Lateral rigidity of spring frame, quality of material, and life of engine parts.

"J.H." (Paisley).—Norton Big Four (solo and with sidecar): Speed, reliability, quality of material and durability, and climbing.

"J.A.S." (Salisbury).—3½ h.p. Norton with direct belt or Philipson pulley drive.

"J.S." (Dulwich).—Four-cylinder Henderson: General experiences.

"V.N.S." (Goole).—Dry battery lighting sets, using from three to four hours twice a week: Expense of upkeep, etc.

"H.H." (Denton).—3 h.p. Royal Ruby: Speed, comfort, reliability, consumption, acceleration, and control at speed.

"C.S." (India).—12 h.p. A.C.E., with sidecar: Consumption, detachability of back wheel, accessibility of carburettor, etc. 8 h.p. Matchless and sidecar and 8 h.p. Sunbeam, ditto: Speed, accessibility, ease of wheel changing, luggage capacity, etc.

"R.G.R." (Eton).—O.K. Junior, single-speed (Mark XI): General experiences.

"E.R.S." (Northumberland).—Brough-Superior: Especially reliability of o.h.v. mechanism for hard riding on long journeys.

"G.G.H." (Higham Ferrers).—5 h.p. N.U.T.: Speed, consumption, and reliability (solo or sidecar), and same questions regarding the 4 h.p. Coulson-B.

"J.H.C." (London, N.16).—3½ h.p. Scott, 3½ h.p. P. and M., or 3½ h.p. Ariel (as solo machine): Reliability, climbing, saddle comfort, fork springing, and consumption.

Will the following readers forward full addresses so that replies may be sent to them?: "C.T.P." (Northwood) and "J.L.H." (Worthing).

TO CLUB SECRETARIES.

"The Motor Cycle" Film will shortly be available for loan to enterprising clubs who are keen to make their winter social events a success. This exclusive film takes about forty minutes to exhibit, and the programme includes scenes at the Junior and Senior T.T. Races, the 500 Miles Race, the Six Days Trials, and the Grand Prix Car Race. Club secretaries should write to the Editor (Film Department), "The Motor Cycle," Coventry, suggesting two or three alternative dates, preferably in January or after.

A Competition Rider's Venture.

Motor cyclists in the Birmingham district who require expert assistance in tuning and repairs should note that G. E. Stobart, the well-known James competition rider, has established himself in business at 6, Minsiead Road, Erdington.

Similarity of Names.

The N.W. London M.C.C. gymkhana took place at the Stag Lane Aerodrome, while the North London M.C.C. rally, which was held last month, was at Hendon Aerodrome. Some confusion as to the organisers of the two appears to have occurred.

Found on the Road.

An Avon inner tube, size 30×3½ in., was picked up between Newtown and Caerlŷs by Mr. J. Robinson, of the Widnes Foundry Co., Ltd. Widnes, on October 7th; while the secretary of the Sutton Coldfield Club (Mr. P. Mosedale, the Nook, Maney Hill Road, Sutton Coldfield) reports that a leather helmet was left behind on Penkridge Bank after the hill-climb on October 8th.

Speed Trials in Belgium.

During a recent meeting at Monfauign, near Liège, organised by the Belgian Motor Union, some excellent performances by Triumph machines over the flying kilometre were recorded. In the professional class (500 c.c.) M. Antoine covered the distance in 29½ s. (76 m.p.h.), and in the 600 c.c. sidecar division of the same class M. Philippart took 40½ s. (54 m.p.h.). A Triumph was also first in the 600 c.c. amateur class, viz., M. Thys, 34½ s. (65½ m.p.h.).

At the same meeting a single-cylinder F.N. made fastest time in the 250 c.c. class, while against all comers the four-cylinder F.N. proved the winner.

Catalogues Received.

Butterfields, Ltd., Levis Works, Stechford, Birmingham: the seventh edition of "Driving Instructions and Useful Hints and Tips." A most complete handbook for users of Levis motor cycles.

Norton Motors, Ltd., Bracebridge Street, Birmingham: a booklet describing Norton models which are specially constructed for overseas use. These include the Big Four, the 3½ h.p. Sports model, and the *de luxe* sidecar outfit. Mr. J. L. Norton is at the present time in our overseas dominions studying motor cycle conditions.

Leopold Ward, A.C.G.I., B.Sc., Harwood Place, Chalk Farm, London, N.W.: "Some Notes on Experimental and Research Engineering": a small booklet dealing with several interesting motor cycle engines and other engineering appliances made by Mr. Ward. Some of these have been dealt with in *The Motor Cycle*.

Advance Details of 1922 Models.

The New Imperial Programme.

A Loop Frame Lightweight with Engine and Gear Unit Assembly.

AS makers of lightweight motor cycles, New Imperial Cycles, Ltd., have had a wonderfully successful year. Perhaps the most outstanding success was the winning of *The Motor Cycle Cup* for the 250 c.c. Tourist Trophy, and in this respect it must be remembered that the firm have marketed their little T.T. model, and have also run it most successfully in reliability trials.

We ourselves have had some little road experience with the machine, and have found it thoroughly roadworthy and far from being a purely racing mount.

The A.C.U. Six Days Trials and the 500 Mile Race at Brooklands have added to the New Imperial laurels, and no fewer than thirty-five special trophies have been won, while gold medal awards are innumerable.

Similar machines to the Tourist Trophy type will be listed for 1922, but much interest will be concentrated on a modified type, which is the subject of the sub-joined notes.

New! Engine Mounting.

Driven by a New Imperial-Jap engine of 293 c.c., the engine is mounted on long bearer plates, on which are carried the magneto—directly behind the cylinder—and the three-speed gear box. Thus, the engine forms a unit with the main part of the transmission, and the whole can be detached from the loop frame by merely uncoupling the petrol and oil pipes and removing three accessible bolts. Many detail refinements are included in this unit. For instance, a breather is fitted to the gear box, and this has been found to obviate oil leaks almost entirely. A rubber return stop has been fitted to the kick-starter, and ball and roller bearings will be fitted to the engine.

The loop frame is a sturdy piece of construction, and is particularly rigid laterally, as we can testify from a short

Showing the neat disposition of the engine, gear box, and magneto.

New points in the New Imperial are a loop frame, all-chain drive, and an internal expanding rear brake.

run. Transmission is by chain through-out, and an adjustable shock absorber is fitted on the engine-shaft. The primary chain is well protected by a metal guard, and a special guard protects both top and lower runs of the low speed chain without entirely enclosing it.

The rear spindle of the New Imperial is held in substantial steel blocks, and correct chain tension is effected by screw adjusters.

Very wide domed mudguards are fitted, and the spring forks have undergone slight modifications.

External expanding brakes are fitted to both wheels, that in the rear having aluminium shoes faced with Don friction fabric, the surface being ground true in position.

Rear chain adjustment is effected by screws carried in the fork end, and butting against solid steel blocks in which the spindle is carried.

The comfort of the rider has been carefully studied, and, in addition to a comfortable saddle, large aluminium footplates are fitted, and ingeniously arranged leg shields may be added. These shields are unusual in appearance, since they lie rather on the inside of the leg than to the front; but, in this position, they catch the mud—which is not trapped by the front guard, and act as air deflectors to increase cylinder cooling: they do not interfere with the simple device for adjusting the footboards.

The valve gear of the engine is particularly silent, and a large aluminium muffler with long tail pipe effectively reduces the exhaust noise.

Altogether, this is one of the most completely fitted and practical lightweights which we have examined, and on the road it is fast, silent, and easy to control.

The standard machine is fitted with 26in. wheels. The tyre section is not yet finally settled; but a model will be made with 24in. wheels to suit ladies or short riders. Sports models fitted with 250 or 350 c.c. J.A.P. engines may be obtained, and these will have clutch but no kick-starter, and will be fitted with footrests, narrower guards, and lighter equipment. These models will be in addition to the chain and belt range.

Long plates carry the engine, gear box, and magneto on the loop frame New Imperial. Note the gear box breather, and rubber stop for the kick-starter.

It must not be forgotten that 8 h.p. passenger machines are a feature of the company's programme, though for 1922 only minor modifications, such as Timken roller bearing hubs and an ingenious sidecar standard have been incorporated.

Nevertheless, an 8 h.p. sporting mount fitted with the latest type of side-by-side valve J.A.P. engine will supply the needs of the "big twin" speed enthusiast.

A Wide Range of New Hudson Models.

Water-cooled Three-wheeler, 4 h.p. Single, Lightweight Two-stroke with All-chain Drive.

AT the last Olympia Motor Cycle Show something of a sensation was caused by the production of a beautifully finished three-wheeler by the New Hudson concern. This machine has now undergone several modifications, and, in its new form, has already proved itself on the road. The layout of the chassis is simple and workmanlike, and there is an atmosphere of solidity which seldom surrounds the normal light car, whether three or four-wheeled.

Carried on the frame by stout aluminium castings, a 10 h.p. water-cooled M.A.G. engine transmits its power through a single dry plate clutch to a three-speed and reverse gear box. A simple clutch stop is brought into action by a full depression of the pedal, and the propeller-shaft has a flexible joint arranged immediately in front of the gear box. In the rear portion of the gear box is a pair of bevels and a cross-shaft, and all the gear selector mechanism is protected by an aluminium housing. Final

A de luxe model 2½ h.p. two-stroke, with all-chain drive, upswept footboards and leg-shields, is added to the New Hudson range.

that, after removing the knock-out rear spindle, the wheel comes away, leaving the chain sprocket and brakes *in situ*. The brakes, by the way, both act on the

New Hudson, Ltd., are by no means newcomers to the passenger motor cycle world, so that peculiar interest attaches to their return to this field. The new 4 h.p. New Hudson has a single-cylinder engine of 87×100 mm. bore and stroke (594 c.c.). The side-by-side valves are operated by a single cam, and clear air spaces are left between the cylinder walls and gas ports. A two-ringed aluminium piston is fitted, and plain bearings are used throughout, special precautions being taken to avoid oil leakage. The transmission is by chain, a shock absorber being mounted on the engine-shaft, and a Sturmey-Archer three-speed box being fitted to the bottom bracket casting. The magneto is carried behind the cylinder, and draw-bolt adjustments are provided for tensioning both magneto and primary drive chains. A special arrangement of change speed mechanism is provided, the operating lever protruding through the tank in a convenient position. Aluminium footplates and sensible legshields are fitted, and the front chain is protected by a cast aluminium guard, which extends rearwards over the front end of the rear

Internal expanding brakes, chain drive, with quick detachable rear wheel, leg-shields, and a very comfortable sidecar, are features of the 4 h.p. New Hudson outfit.

transmission is by chain. Channel steel side members, with two channel and two tubular cross members, comprise the frame, which is additionally cross-braced by intersecting tubes. Within the front channel cross member, and protected by its flanges, lies the rack and pinion steering gear, which is connected directly to the tie-rod immediately behind the steel tubular front axle. The rear tubular cross member forms a support for the back of the gear box, and also a pivot for the centre of the long cantilever rear springs. A tubular frame carries the rear wheel chain, tension being adjustable by means of eccentrics on the front end of the radius rods. The chassis is supported in front by quarter-elliptic springs.

Such is the bare specification of the New Hudson three-wheeler, but there are many interesting features which are well worthy of attention. For instance, the wheels, shod with 26×3in. Dunlop light car tyres, are quickly detachable and interchangeable. A permanent jack is incorporated in the rear frame, by means of which the rear wheel can be raised from the ground with the least possible delay. It should be mentioned, also,

rear chain ring, the hand brake being of the contracting type and the foot brake having expanding shoes.

A spare-wheel is included in the specification, as also are a Lucas Magdyno, driven by bevel gear from the front of the engine, and a Cox-Atmos carburetter. Lubrication of hubs and other working parts is effected by means of a screw-in grease gun.

A deep and luxuriously upholstered body, with screen, hood, and good mudguards, is fitted to the very attractive vehicle, and a neat radiator admirably sets off the whole. It is a most elaborate model.

A permanent jack is incorporated in the rear frame of the three-wheeler, and the brakes and chain are unaffected by the removal of the rear wheel. Interchangeable wheels, with a spare, are supplied.

Advance Details of 1922 Models.—

chain. A sheet metal extension protects the rear chain from mudguard drippings. Special provision has been made for quick detachment of the rear wheel, and very wide domed mudguards are fitted.

Attached to this very practical looking machine is a roomy coachbuilt sidecar, suspended on C springs, front and rear, from a rectangular chassis. The chassis is underslung, and is attached to the motor cycle at four points. A wide mudguard is mounted on the sidecar body. It is probable that 26×3in. tyres will be fitted all round, and the complete outfit is to sell at a very attractive figure.

A minor point, which, however, is not without importance, especially from an overseas point of view, is that a 6in. ground clearance is obtained. This end has been achieved without making the machine unduly high or ungainly.

Lightweights.

In addition to the well-known 2½ h.p. two-stroke popular model, a similar

engine with all-chain transmission and Sturmey-Archer two-speed gear with clutch and kick-starter will be marketed. This little machine will be turned out with foot plates, legshields, air deflector to plug, and 24×2½in. tyres. The specification should be ideal for the business man, since sensible mudguards have not been forgotten.

New Hudson lightweights have already made a name for themselves, both in the hands of private users and in open competition work. Oddly enough, though this little machine is particularly well adapted for a short rider, the seating arrangements are such that even a large man neither looks nor feels ungainly—in fact, one

One of the cleanest but most complete three-wheeler chassis which has yet appeared—the 10 h.p. New Hudson.

The low centre of gravity of the New Hudson three-wheeler provides great stability, but does not interfere with the ground clearance or smart appearance of the machine.

The Metro-Tyler Cycle Car.

A Lightweight Runabout driven by Two 2½ h.p. Engines.

A FOUR-WHEELER built on purely motor cycle lines is the £125 M.-T. cycle car, which is driven by two 2½ h.p. 70×70 mm. M.-T. two-stroke engines coupled together, with the

Double quarter elliptical springs are used for the front springing. The starting lever, it will be observed, can be operated from the driver's seat.

The M.-T. cycle car, a neat little four-wheeler, having as the power unit two 2½ h.p. two-stroke engines coupled together.

crankshafts in line. This unit is fitted in a strengthened ash frame. The gear box is the well-known Sturmey-Archer incorporating three speeds and clutch, the starting mechanism being connected to a lever within reach of the driver so that the engine can be conveniently started from the seat. From the gear box to the live back axle the drive is by lin. belt, while the axle runs on roller and thrust bearings situated in housings between the double-quarter elliptical springs, this method of springing being adopted for the front of the vehicle as well. The gear ratios are 5½,

8½, and 13 to 1, and it is hoped to incorporate a reverse in future models as an extra. The carburetter is a Zenith, and is controlled by the ordinary accelerator pedal.

A roomy two-seater body is fitted provided with ample lockers. We had a short run on the machine, and found the steering, though direct, to be quite effective. The twin engines seemed to possess ample pulling power, and, starting by means of the side lever, was simplicity itself, the engines starting on the first pull over, nor were they unduly noisy.

SPARKING PLUGS

7/8 STANDARD KLG 'G' SERIES

- Type G 1—for average engines—standard metric thread, 12 m/m. reach.
- Type G 2—for average engines—standard metric thread, 18 m/m. reach.
- Type G 3—for American Cars taking A.L.A.M. threads, 1/2 in. reach.
- Type G 4—for American Cars taking A.L.A.M. threads, 3/4 in. reach. Suitable for the latest 'Buick' Cars.
- Type G 5—the popular 'Ford' model, and for American Cars taking 1/2 in. gas thread.

THE DESIGN OF THESE PLUGS INCORPORATES THE FOLLOWING NEW & UNIQUE ADVANTAGES—

- A. The plug body and gland nut, which constitute the permanent portions of the plug, are treated by a special process before assembling which renders them rust-proof and absolutely obviates the not infrequent trouble caused by the plug "seizing" in the cylinder.
- B. The central electrode and insulation can be readily removed from the plug by unscrewing the gland nut without the necessity of removing the plug body from the engine cylinder. This renders possible the inspection and thorough cleansing of the insulation.
- C. Complete "centres" for renewals can be supplied and carried as spares. With ordinary care the original plug body and gland nut should last almost indefinitely.

Hazlewood Introductions.

Sporting and Touring Lightweight. Passenger Machines mainly Unchanged.

A LIGHTWEIGHT will be added to the existing range of Hazlewood models for 1922. Carried in a frame with dropped top tube, a 293 c.c.

The new lightweight Hazlewood incorporates the 293 c.c. J.A.P. engine, and has a serviceable black finish.

J.A.P. engine drives the rear wheel through a two-speed Sturmey-Archer gear with clutch and kick starter, the final drive being by belt. Aluminium foot plates, a cast aluminium chain cover, B. and B. carburetter, and Best and Lloyd drip lubricator, are included in the specification. A sports model, with long exhaust pipe and footrests in place of footboards, is listed, and is fitted with a neat rear brake, the whole of which, with its operating pedal, can be readily removed, should tyre trouble necessitate the withdrawal of the rear wheel. This machine is listed at £70. A somewhat

similar but more stoutly constructed machine will be marketed, and will carry a 4 h.p. J.A.P. engine and three-speed gear.

All Hazlewood models are fitted with wide Druid type forks, and mudguarding has received very special attention, being most efficient. The existing 6 h.p. model, with chain and belt drive, and the 8 h.p. type, with all chain drive, will be retained, but the latter will in future be fitted with an internal expanding rear brake.

The makers are Hazlewood's, Ltd., Coventry.

The rear brake unit of the new lightweight Hazlewood is easily detachable to facilitate wheel removal.

A Clutch Model Velocette.

Re-designed Gear Box now incorporates a Kick-starter.

UNCHANGED in its more characteristic features, the 1922 Velocette is, nevertheless, worthy of special attention, since a very considerable change has been made in the transmission. An

entirely new gear box is now fitted, and includes a cork clutch and kick starter. The three-speed gear is a very ingenious piece of work. Both shafts run on ball bearings, and heavy pitch teeth are used. Top and low gears are engaged by dogs, but the middle gears are meshed as in normal car practice. It should be mentioned, however, that these gears are of the same pitch and width as employed by many 6 h.p. machines. An unusual feature lies in the fact that the final drive chain lies outside the clutch, the sprocket being locked to its shaft by face dogs.

In spite of this, the clutch is extremely accessible, and

can be reached by the removal of one hexagon and one ring nut. The middle plate runs on a ball race when free, and the outer plates are pressed together by a number of small coil springs, which are so arranged that the locking nut can be started on its thread before compressing the springs. Clutch operation is effected by face cams operating on pegs, the controlling lever lying between the clutch and the gear box. No extra gears or quadrants are employed in the design of the kick-starter, which works on the free-wheel principle, a roller being forced outwards into a groove by the action of a cam on the

starter spindle. The action is positive; and, by means of an ingenious and simple arrangement of safety device, the roller is forced out of its groove in the case of a back-fire. A two-speed

The gate quadrant is fitted on the front end of the tank.

Compact design and sturdy construction are the essential features of the three-speed Velocette gear box with clutch and kick-starter.

gear box of similar type may be supplied; but in this case a plain bearing layshaft is used. The two-speed gear supplied for the sports model, however, has ball bearings throughout, but no kick starter is fitted. Detail modifications have taken place in the chain guards to improve accessibility. Wider front forks have been adopted to avoid trapping the mudguard; and wider rear hub, forks, and mudguards are fitted. The new lightweight M-L magneto is to be standardised. Gear operation is now by means of a gate quadrant, and the spark advance lever incorporates a simple cork friction device.

B.T.H. Novelties.

Combined Lighting and Ignition Apparatus in Various Forms.

AS far as concerns two-stroke engines, the B.T.H. Sparklight ignition and lighting set has already made its name; but until recent times the system of utilising the idle maximum point of the magneto has been confined mostly to

The new B.T.H. Sparklight for four-strokes. Note the distributor box.

that type of engine. The B.T.H. Co. has, however, just introduced a modified set for four-stroke engines.

In this appliance, the magneto is driven at engine speed, and, consequently, gives a better spark for starting and at low speeds. The Sparklight collector attached in place of the contact breaker cover remains unaltered; but, since with this arrangement two sparks are generated where only one is needed, a simple distributor with two terminals has been added. By this means the waste spark is earthed, and the useful spark is led to the plug in the normal manner.

Prolonged Road Test.

The new system has been given a prolonged road testing and has proved thoroughly reliable. A four-volt twelve ampere battery is carried on the handlebar and a five watt head lamp bulb is employed.

The B.T.H. flywheel magneto and lighting set has been improved in detail, and will form a standard line for 1922. In addition, a mag-generator of interesting construction will be exhibited for the first time at Olympia.

The magneto and dynamo of this set form separate units, which are dovetailed

together; but, contrary to usual practice, it is the generator which is driven from the engine (at half engine speed in the case of motor cycles), and the magneto which is driven from the generator spindle. This system imposes less loading on the gears, which connect the two spindles, the driven gear in the B.T.H. set being of a special composition manufactured by the firm. A cut-out is embodied in the dynamo and Cobalt steel magnets are used for both ignition and lighting sets. An output of twenty watts is claimed at 1,200 r.p.m. of the armature.

Head lamp and battery box of the B.T.H. Sparklight set. A 4 volt 12 amp battery and 5 watt bulb are used.

Bown Additions.

IN addition to the 2½ h.p. Blackburne and 2½ h.p. Villiers models, Bown, Ltd., will market a neat little touring machine fitted with the 2½ h.p. J.A.P. engine (293 c.c.). An Albion two-speed gear with clutch and kick-starter is fitted, chain and belt drive being employed. Druid forks, M-L magneto, 26 x 2½ in. tyres, B. and B. carburetter, and an internal V brake are used, and all the fittings are of good quality. The rear forks of all models are now wider to prevent trapping of the guard. Lubrication of the engine is through a Best and Lloyd sight feed device, and the primary chain is well protected by a neat cover. A dropped top tube frame is retained, and the general appearance is good.

A neat little 2½ h.p. J.A.P. model has been added to the Bown programme.

Liberty Engine Modifications.

Built-up Crankshaft of Unusual Design.

STEADY progress is being made in the design of Liberty two-stroke engine manufactured by A. W. Wall, Ltd., of Tyseley, Birmingham, and several modifications are included in the design for 1922. The engine is of the normal three-port design, and is beautifully made, the crankshaft being a particularly fine piece of work. Each shaft and crank cheek is formed from a special steel forging, and is machined and ground until it takes the form of a miniature internal flywheel, complete with balance weight. Plain bearings are used on the main shaft, but the crank pin, which is utilised to bolt together the two sides of the shaft, is fitted with a roller bearing

big end. The hollow gudgeon pin is carried rather high up in the piston, and is located endwise by the lower of two piston rings, the lower edge of the groove being bevelled off so as to trap the oil. The cylinder is well finned, and in practice has been found to cool very satisfactorily. Every engine is given a thorough bench test before it leaves the

The Liberty crankshaft is built up of two forgings. A roller bearing big end is used.

works. An Amac carburetter has been found to give excellent results.

Naturally, an outside flywheel is also fitted. Besides the increased rigidity of the built-up form of crank construction, another advantage is that, by reducing the crank case volume, crank case pressure is increased.

The Reynolds runabout, which is manufactured by the same firm, and is, of course, fitted with the Liberty engine, will in future be fitted with 24 in. wheels and all-chain drive. It is probable that further developments on interesting lines will take place in the near future, but for the moment our tongue is tied.

Piston of Liberty two-stroke, showing the lower ring groove. The ring acts as a gudgeon-pin keep.

A Sporting Francis-Barnett.

2½ h.p. J.A.P. Engine, Three-speed Gear Box, All-chain Drive.

ONE of the most attractive lightweight machines which will be exhibited at Olympia is the sports model Francis-Barnett. Incorporating the 350 c.c. J.A.P. engine, a three-speed lightweight Sturmey-Archer gear with clutch and kick-starter, all-chain drive, and an Enfield shock absorber, the whole machine weighs only 190 lb. Every detail has been carefully thought out, and though there may be other machines with a somewhat similar specification, it is in detail refinements, so dear to the heart of the enthusiast, that the Francis-Barnett excels. 26×2¼ in. extra heavy tyres covered by wide flat section guards, Brampton forks with a positive stop to prevent the handle-bars damaging the tank, and a stand which is particularly neat and

The latest 2½ h.p. Sports Model Francis-Barnett in an unfinished state. A 350 c.c. J.A.P. engine and three-speed lightweight Sturmey-Archer gear are fitted.

One of the many neat features of the Francis-Barnett is the fact that the change speed lever is mounted with the gear box. The unit is adjustable endwise by means of an eccentric operated by a projecting stud.

strong help to make the machine serviceable. The tank is of the saddle type associated with the Francis-Barnett name, and all the control wires pass through the space between the two tank partitions, so that they are out of sight for the greater part of their length. The B. and B. carburetter and the new M-L lightweight magneto are part of the equipment.

The operating lever of the Sturmey-Archer three-speed gear is mounted on the bottom bracket and secured by the same nuts as the gear box itself, so that when the primary chain is adjusted there is no need for adjustment of the gear control rod. It will be remembered that

a positive chain adjustment is provided, the gear box being moved by an eccentric on the lower end of a stud which projects through the bottom bracket casting.

Footrests only are fitted, but these can be set in five different positions by merely slacking off a nut and replacing the locating peg in any one of a series of holes.

The finish, which, by the way, is excellent, is in black throughout, a minimum number of plated parts being used. A Webb front brake is fitted, and the rear brake is of the V type acting inside the groove of a dummy belt rim. It should be added that there are no clips on the machine except for handle-bar fittings.

Blackburne Engines for 1922.

Four Singles and Four Twins to be offered Next Year.

BLACKBURNE engines for 1922 will include at least two completely new models. These are the 4½ h.p. and the 2½ h.p. T.T. engines. The larger of these has a bore and stroke of 85×97 mm. (548 c.c.), and like all the latest pattern Blackburne engines the finish has been much improved, the crank case being sand-blasted, and the magneto and timing gear cases polished.

The chief improvements in this pattern lie in the provision of larger and deeper

radiating fins, especially round the valve ports, a roller bearing big end, and a new cam and exhaust rocker. The new cam

is so designed that it first lifts the valve gradually, then opens it rapidly, keeps it open a longer period than the old cam, and then allows it to close quickly; consequently, on account of the overlap, greater efficiency is obtained. The crankshaft is of the built-up variety, while the crank webs are steel stampings.

It is interesting to be able to record that the T.T. engine, with overhead valves, which came near to winning the Junior T.T., is to be placed on the market for the coming year. Since the classic event, however, it has undergone several modifications, one of these being the placing of the sprocket outside the flywheel, thus reducing the overhang and

The connecting rod, flywheel and cam wheel.

A feature of the new 4½ h.p. Blackburne engine is the increased size of radiating fins round the valve ports.

The skew gear magneto drive with the cover removed.

Advance Details of 1922 Models.—

bringing the flywheel nearer the crank case. This arrangement not only brings the sprocket 1½ in. closer to the crank case, but considerably facilitates the enclosure of the chains. The new flywheel is lighter than the old pattern, has the inside of the mainshaft hole hollowed out, and the main bearing boss slightly chamfered.

The split hardened steel bushes for the o.h.v. rockers are mounted on supports screwed into the detachable head and secured by a lock-nut. In the case of the latest models, the main adjustment is effected by means of the usual adjustable tappet as found on side valve engines; but further adjustment can be obtained by means of the supports, which may be screwed or unscrewed, and then held by the lock-nut. No adjustment is now provided on the end of the rocker arm, which strikes the valve stem; but, following car practice, a cam pad is provided. The timing gear is the same as the standard 2½ h.p. engine.

Great care is taken to prevent distortion in the Blackburne cylinders and other parts; and all castings, such as cylinders, pistons, and cylinder heads are normalised—that is to say, they are first rough machined, then put in an oven, and heated to 800° C. for two hours, and allowed to cool; the process is then repeated, and the cylinders are finally finished off.

The 2½ h.p. overhead valve T.T. pattern, which will be placed on the market as a standard production.

The piston is of standard design, but is very light. The full range of 1922 engines consists of the following: The 2½ h.p. standard model; the 2½ h.p. T.T. pattern, as described above; the standard 4 h.p. and the 4½ h.p. new type with roller big-end, previously referred to; the 5-6 h.p. twin, 71×88 mm., 696 c.c.; the 8 h.p., 85×88 mm., 998 c.c.; and the 10 h.p., air or water-cooled, 85×97 mm., 1,098 c.c. All Blackburne twin-cylinder engines have the cylinders set at 60°, and all may be fitted with the spiral drive magneto, and are suitable for motor cycles or cycle cars. Naturally, the well-known features of these engines—the detachable head and outside flywheel—are retained.

DUNELT REFINEMENTS.

NO radical changes will take place in next year's Dunelt models except in the matter of price. The shape of the tank will be modified for the sake of appearance, a longer and more conveniently placed brake pedal will be fitted, and the aluminium foot plates will be splayed outwards at the front so as to provide a more natural riding position. (This is a feature which might well be adopted by other manufacturers.) Detail alteration will take place in the steering head ball races, and purchasers will be offered the option of 28×3 in. tyres at a slightly increased cost.

Raleigh Lightweights.

AS first announced in *The Motor Cycle* of September 22nd, when a full description of the new model was published, lightweight machines will form an important addition to the Raleigh programme for 1922.

The prices of the new models have now been fixed, and prove to be surprisingly moderate, the two-speed 2½ h.p. machine

(with a 348 c.c. engine) being only £68. A similar machine as a sports model, with a two-speed gear box, T.T. bars, and footrests in lieu of footboards, is listed at the same figure. These models, with a three-speed box cost an extra £5.

In its third form, as a lightweight sidecar outfit, the price is £105 complete with sidecar. In this case the bore of

the engine has been increased, bringing the capacity up to 400 c.c., rated at 3 h.p.

The luxurious 5-6 h.p. flat twin Raleigh, with spring frame, is, of course, retained, and may now be obtained either solo or as a *de luxe* or standard sidecar outfit. It has not been found necessary to make any modifications of note specially for the Show.

The Pioneer of Pneumatic Tyres.

Soma Details of the Late Mr. J. B. Dunlop's Career.

MOTOR cyclists as a body will have learned with regret of the passing away of Mr. John Boyd Dunlop, which took place in Dublin on October 24th.

It is not unreasonable to say that high-speed road vehicles—cycles, motor cycles, and cars—not to mention aeroplanes, all owe their present popularity and success to the pneumatic tyres which Mr. Dunlop invented in 1887, and which made possible the successful application of the rapidly developed internal combustion engines to fast-moving machines.

The story of the Dunlop tyre is well known, its inception being the outcome of an effort to render the tricycle of the inventor's nine-year old son vibration free. Despite crude construction, the tyre, made of canvas solutioned to a flat rim, was successful, and it became popular amongst racing cyclists in the North of Ireland. The fame of the Dunlop tyre spread further afield, and many subsidiary patents were obtained, bought and fought over by those who were financially interested in the new tyres.

The late Mr. J. B. Dunlop.

Mr. Dunlop was a Scotsman, born in Ayr in 1839, and was educated at Edinburgh University. A veterinary surgeon by profession, he was not devoted to the

cycle or motor industry very intimately other than as the inventor of the tyre which bore his name. He practised in Scotland before settling in Belfast, where he lived many years.

OFFICIAL TEST OF FALLOLITE.

On September 3rd the R.A.C. tested the Fallolite motor cycle head light, which contains an atmospheric acetylene burner the flame from which impinges on a pastille. In the certificate which is now issued, it is stated that the jet showed a consumption of 0.34 cubic foot of gas per hour. At an eye level of 4ft. any dazzling effect ceased at a distance of 253ft. from the lamp. A motor cyclist using this lamp when approaching a pedestrian so dressed as to be seen only with difficulty, would be able to pick him out at a distance of 127ft. provided he was within 4½ft. of the centre of the beam. It would not be possible for a rider to see a pedestrian step into the roadway 30ft. wide.

A MIXED FIELD ON THE WELSH BORDER.

Worcester Clubs Reliability Trial. Motor Cycles, Sidecars, Cycle Cars, and Cars Compete on Level Terms for President's Award.

ON Saturday, under fine weather conditions and over road surfaces which were mercifully dry, the Worcester and District M.C.C. and the Worcester-shire Motor Club joined forces in a one day trial of 115 miles.

Eight checks were taken throughout the day, each check being complete in itself, à la Scottish Trials. The first thirty miles was over good main roads, via Bromyard and Leominster to Amestry, where, amidst typical Herefordshire scenery and the scent of cider apples, the competitors switched into winding ways and tortuous paths. At this point quite a stiff hill was encountered, but it was unobserved. Between Lingen and Presteigne was the first observed watersplash; and although this section of the route was avoidable, everyone elected to essay it on the chance of earning a bonus mark. They "had jam on," as the saying is, for the splash was only about 12in. wide, although a local press report forecasted it as being 35 yards long!

The next observed point was at Gladestry; everyone negotiated the splash and the subsequent gentle gradient following with greater or less ease except E. R. N. Main (8 Zenith), who suffered belt slip on the hill. P. Andrews, on a 4½ h.p. B.S.A. sidecar, also had a slipping belt, but, despite a slow recovery on the hill, he did not actually stop.

Passenger Machines Good.

Of the other machines, the Enfield sidecars were all good, while the Morgan team, Carr, Shaw, and Leeke, were up to form as usual. G. C. Rogers (3½ Sunbeam) just touched ground with a foot; he, Main, and J. A. Newman (3½ Douglas) were the only soloists, for J. Edkins (2½ Allon) had already retired.

The watersplash at Gladestry; J. L. Shaw (10 Morgan) approaching the water at a gentle pace in the Worcester Club's President's Cup Trial.

From here onwards the going was rough and bumpy, but otherwise easy to Clyro, thence to Glasbury and an excellent lunch at the Three Cocks.

In the afternoon the great adventure was Trefadoc (near Hay), associated as the sting in the tail of the famous Two Days Worcester Club trial of last April.

On that occasion rain and hail made Trefadoc a terror, almost unclimbable; on Saturday it was as easy as rolling off a log. R. Brown (3½ Sunbeam sc.) was the first arrival, and he made light work of the ascent; Main (8 Zenith) just touched with his foot on one corner; P. Andrews (4½ B.S.A. sc.) was troubled with a knocking engine and excessive belt slip; G. H. Leeke (10 Morgan) made a fast ascent, his back wheel tilting over to an extraordinary degree on the bends. W. J. Knight (8 Enfield sc.) almost skidded into the bank, but recovered well; S. W. Lewis (6 B.S.A. sc.) failed through clutch slip, although he evidently thought the wheel was spinning; B. Bladder (8 New Imperial sc.) was fast all the way up; J. A. Newman (3½ Douglas) potted up the 1 in 4, whistling blithely, but N. Bacon (8 Enfield sc.), after being allowed a second attempt owing to being balked, was again unsuccessful.

After Trefadoc the remaining forty-five miles was mostly main road running via Hereford back to Worcester.

The following started:

J. Edkins (2½ Allon)
R. Brown (3½ Sunbeam sc.)
G. H. Leeke (10 Morgan)
E. R. N. Main (8 Zenith)
W. A. Carr (10 Morgan)
J. M. Decher (8 Enfield sc.)
N. Bacon (8 Enfield sc.)
W. J. Knight (8 Enfield sc.)
P. Andrews (4½ B.S.A. sc.)
F. Morrall (4½ B.S.A. sc.)
J. L. Shaw (10 Morgan)
G. C. Rogers (3½ Sunbeam)
B. Bladder (8 New Imperial sc.)
J. A. Newman (3½ Douglas)
S. W. Lewis (6 B.S.A. sc.)

Of these, only Edkins failed to finish, but Leeke, Morrall, Andrews, and Bacon were all late. Incidentally, seven cars started, and all finished except one.

On Trefadoc. S. W. Lewis (6 B.S.A. sidecar) on one of the lower bends; higher up a slipping clutch spoiled his ascent.

AMATEURS ON FREAK HILLS.

Sheffield University M.C.C.
Club Members' Reliability
Trial in North Derbyshire.

There are two ways of getting up Litton Slack; this is "Easy Litton," but H. Davies (3½ James) does not appear to agree with the qualification!

A TRIAL over difficult roads with all the riders the purest of amateurs, and many of them newcomers to competition riding, is always full of interest, and teaches more than many a duly sanctioned and officially supported open event.

Such a competition was held on Wednesday afternoon, the 26th of October, by the Sheffield University M.C.C., a "young" club which hopes to foster the best interests of the sport amongst present and ex-members of the University. Unfortunately, the entry of twenty-one was rather small, but still worse was the fact that seven of these failed to face the starter.

1914 Six Days Hills.

Briefly, the route consisted of a main road run of twenty-two miles from Sheffield *via* Baslow, Hassop, and Ashford to Taddington, near Buxton. Here commenced a circuit of sixteen and a half miles, to be completed three times, which included Miller's Dale, Litton Slack (the "easy" way, and not too easy at that!), Taddington, Cowdale, Kingsterdale, and Taddington again. The course consisted of winding lanes, which made speed impossible, but the surfaces throughout were dry; the bottom portion of Litton Slack was rather loose, but not so bad as in the summer. All reached the commencement of the first circuit except F. Adcock (2½ Douglas), who had new (and too tight) piston rings, but H. E. Stone was delayed through losing the crank case drain plug of his 6-7 h.p. Ariel sidecar. Stone's fear of a seizure was confirmed after a village repair man had screwed a bolt into the hole, for the engine had become immovable while this was being done. After many efforts, some bright person unscrewed this temporary plug, when it was found that the engine

once more revolved, and after filing down the bolt, so that it did not lock the flywheels, the driver and his passenger settled down to retrieve their lost time!

The easy way up Litton Slack involves some hard climbing on a loose, stony surface and two hairpin corners, one being fairly acute. C. F. Boothroyd (4 Norton) broke his throttle wire at the bottom, and was compelled to retire; while E. Banks (on an ancient 5-6 Indian), H. Woffenden (2½ Royal Ruby), D. Bailey (2½ A.J.S.), and H. Davies (3½ James) all used their feet to greater or less degree.

Woffenden and Davies, however, had not studied their route blue prints, however, for both essayed the most difficult path up the Slack, the former realising his mistake too late, hesitating, and becoming lost; while the latter ploughed his lonely way up to the worst patch before "conking" ingloriously. Excellent climbs were made by H. A. Winterbottom (3½ Ariel), H. Soderberg (3½ Sunbeam sc.), and F. Nicol (2½ Sun-Vitesse).

On Cowdale only the unfortunate H. E. Stone failed to make a clean climb on the first circuit; and, after replacing a broken belt, he ascended well with his 6-7 h.p. Ariel sidecar; thus came the forebodings of the Jonahs to nought. E. Banks (5-6 Indian) retired here through a skid; while C. E. Jenkins (2½ Diamond) also withdrew, owing to slipped magneto timing. Good climbs on Cowdale, as on Litton, were made by Winterbottom, who was riding really well; Soderberg, who showed what a 3½ h.p. sidecar can do; and B. Wiggins, whose 3½ h.p. Norton toyed with the gradient. On the second and third circuits Bailey (2½ A.J.S.) and Davies (3½ James) improved their form.

Several time checks were made on a schedule worked out to 3m. per mile for 500 c.c. and larger solos (20 m.p.h.), and 3½m. per mile for lightweights and sidecars (17.1 m.p.h.), and the results were as follows, the figures showing the marks lost.

GOLD MEDAL.—H. A. Winterbottom (3½ Ariel), 1 mark lost.

SILVER MEDAL.—H. Soderberg (3½ Sunbeam sc.), 6.

BRONZE MEDALS.—S. Nicol (2½ Sun-Vitesse), 8, and B. Wiggins (3½ Norton), 8.

The following also checked in at the finish: H. R. Handbidge (3½ Norton), 10; D. C. Bailey (2½ A.J.S.), 11; H. Woffenden (2½ Royal Ruby), 14; and H. Davies (3½ James), 124.

All the awards were presented by Mr. Dan Bradbury, the well-known Norton exponent, and an ex-member of the Sheffield University.

The top hairpin of "Easy Litton." E. Banks (5-6 Indian) taking it steadily.

Times to Light Lamps.

Nov.	3rd	5.29 p.m.
"	5th	5.25 "
"	7th	5.23 "
"	9th	5.19 "

Number-plates to be illuminated thirty minutes earlier, vide Road Vehicles Registration and Licensing Order (1921).

At Brooklands on Saturday.

Saturday's B.M.C.R.C. meeting at Brooklands, the last of the year and including a 500-750 c.c. solo championship, will start at 2 p.m.

Police Trap at Leatherhead.

We have received information of a police trap in the ten-mile limit at Leatherhead. An inspector waits to catch motor cyclists on Swan's Corner Bridge.

A Three-speed Scott.

It is not without interest that the makers of the Scott motor cycle are experimenting with a three-speed gear, which may be on view at Olympia fitted to the sidecar model.

The Late Kennedy Jones, M.P.

In the death of Kennedy Jones, Esq., M.P., the North London M.C.C. lose their president. The club was represented at the memorial service and at the funeral.

1922 Belgian Grand Prix.

We hear that preparations are already afoot for the 1922 Grand Prix race in Belgium, and that it is anticipated that the event will surpass anything that has been done so far in international races in that country. There may also be two international car races.

Show Banquet.

The banquet of the B.C.M.C.M.T.U., preparatory to the Show, has now been fixed for Friday, November 25th, at 7 p.m. in the Grand Hall, Hotel Cecil, Strand, London, W.C. A notable gathering is expected, and tickets can be obtained from the Union's offices (on receipt of remittance—one guinea) not later than November 19th.

More Records.

There is great activity at Brooklands at the present time, where several manufacturers are endeavouring to secure new records before the Show. On Thursday last H. R. Davies, riding a 2½ h.p. A.J.S., beat the standing start ten miles record in Class B, which distance he covered in 8m. 21.8s., equalling 71.74 m.p.h. The next day he improved on this, his time being 8m. 20s. (72 m.p.h.).

Motor Taxation and the Roads.

Speaking at the annual dinner of the Taunton and District M.C. and L.C.C. last week, Mr. F. Wills, of Bridgwater, said he had been very much surprised to hear the county surveyor say that none of the money contributed by the motorists of Somerset in the way of taxes had yet returned for the use of the County Council. This question is exercising the minds of most motorists, who require to know how much of the £9,000,000 obtained from motorists in taxation has been spent on the construction of new, or the improvement of existing, roads.

QUARTERLY LICENCES FOR MOTOR CYCLISTS.

An announcement has been made to the effect that quarterly licences will be issued to motor cyclists dating from January next. An increased rate will have to be paid in respect of these short-term licences, but the exact amount is not yet obtainable.

The Ministry of Transport has decided to carry out this alteration, but up to the present moment the Order has not been issued to the public; consequently, any figures which have been published as regards the rates of the new short-term licences should be taken as inaccurate.

Justice?

A Staffordshire motor cyclist was summoned last week because it was claimed that his front number plate was not illuminated. The defendant maintained that his lamp was in such a position that the numbers would be adequately illuminated, and the Stipendiary intimated that he would examine it if the motor cyclist would bring his machine upstairs. Because he could not do so, the Stipendiary refused to examine it, and fined the defendant 15s.

The Belgian M.C.U. Championship.

The kilometre speed trial recently contested on the road from Dieghem to Nelsbroeck was a great success, and several Belgian records were obtained. The results are as follows: Private owners.—1, Cachy (Norton), 37½s., average speed 95 km.p.h. (59.4 m.p.h.). Trade riders (600 c.c. sidecars).—1, Brahem (Harley-Davidson), 25s., average speed 144 km.p.h. (90 m.p.h.); 2, Taymans (Excelsior), 1,000 c.c. sidecars.—1, Pierard (Excelsior), 34½s., average speed 104 km.p.h. (65 m.p.h.).

Special Features.

ADVANCE DETAILS OF 1922 MODELS VALVE PORT PROPORTIONS.

ROAD TESTS

For the Convenience of Foreign Visitors.

Interpreters in most of the European languages will be available during the Motor Cycle Show at Olympia on application at the Exhibition offices.

French Petrol?

The borings for petroleum in the Department of the Ain, France, are being continued. To the south of Amberieu-en-Bugey, two companies are taking borings near the village of Vaux. Recently a large quantity of hydrocarbide gas was struck, and it is hoped that petroleum may be discovered shortly. Near the village of Torcieu, another company has struck a pocket of gas which produces 100,000 cubic metres per day.

Undergrads and Motor Cycles.

The conflicting claims of motor grease and B.A. degrees were the subject of a lively discussion, when the Cambridge Union Debating Society rejected by 170 votes to 113 a motion calling for a ban on the use of motor vehicles by undergraduates during term time.

Mr. A. S. A. Frere-Reeves, proposing the motion, said motor cycling students read periodicals dealing with the sport instead of attending to lectures. Opposing the motion in a humorous speech, Mr. R. M. Simon "proved" that motor cycling was synonymous with knowledge.

Next Saturday's Open Trial.

Eighty entries have been received for the open trial next Saturday organised by the Midland Centre, A.C.U.

No fewer than twelve teams will compete for *The Motor Cycle* prize. These are as follows: New Imperial, A.J.S., Sunbeam solo, Sunbeam sidecar, Sunbeam (Birmingham), James, Ariel, Mr. Blumfield's Ariel team, Martinsyde, and Sun-Vitesse.

The start is from the Stewpony Hotel (between Wolverhampton and Kidderminster) at 9 a.m., and the first competitor is due back at 4.4 p.m., so that every rider up to time will finish in daylight. The chief points of interest will be Beacon Hill Hairpin (near Bromsgrove) and New Walton Hill (near Redditch) in the morning, and Flagstaff Hill (near the Hundred House), Farlow Bank, and High Oak Hill (near Kidderminster) in the afternoon. Non-skid devices will be in great demand if the weather is damp.

Redditch and District M.C.C.

The following amendments have been made in the published results of the trial on October 8th: H. Malins (8.7 G.N.), gold centre medal instead of silver medal; and C. Jenkins (4½ B.S.A.), silver medal instead of bronze medal.

Central Cornwall M.C.

The club organised a reliability trial over a ninety-six mile course on Thursday last for all makes of cars and cycles. A start was made from St. Austell at two o'clock. There were several secret checks. The results were: 1, J. Ivey (7 A.J.S. sc.), 30 marks lost; 2, M. S. Aldham (Ford), 38 marks; 3, J. Kelly (4 Norton sc.), 39 marks.

Eastern Valley M.C.C.

At 7.30 p.m. on Thursday, November 17th, the club is holding a smoking concert at the Clarence Hotel, when all motor cyclists in the district are invited to be present. The annual dinner will take place on Thursday, December 15th.

Taunton and District M.C. and L.C.C.

Lieut.-Col. Dennis F. Boles presided at the annual dinner of the club on Saturday, October 22nd, and was supported by many of the leading residents of the town and surrounding district. The company numbered nearly one hundred members and friends, and a very enjoyable evening was spent. Representatives were present from a number of neighbouring clubs; and the president distributed the prizes won during the past season, which included four challenge cups and bowls.

Week-end Club Events

Nov. 5.—Cumberland County M.C.C. Lecture on Road Traffic.
Nov. 6.—Sheffield M.C.C. Run to Peak Forest lands.

University College of North Wales M.C.C.

On Wednesday of last week the club opened the new session with a very successful petrol consumption trial over a course ending at the now famous "Screw Hill," where some of the members competed for the medal offered for the best ascent. In the petrol consumption test, competitors were issued with one quart of petrol, and started off in pairs on the twenty-seven mile run to Llythfaen, where those arriving had their remaining petrol measured. Results:

UNDER 480 c.c.—1 and gold medal, T. Lewis (2½ Omega), 138 m.p.g.; 2 and silver medal, M. O. Williams (2½ Lewis), 110 m.p.g.; 3, W. H. Thomas (2½ Francis Barnett), 104 m.p.g.
OVER 480 c.c.—1 and gold medal, T. E. D. Browne (3½ Scott), 150 m.p.g.; 2 and silver medal, M. Griffith, capt. (3½ Sunbeam), 145 m.p.g.; 3, R. S. Evans (4½ B.S.A.), 120 m.p.g.

On the hill the slippery and loose surface; the result of recent rains, accounted for a high percentage of failures, and strenuous efforts on the part of the helpers were called for. J. E. Edwards (3½ Sunbeam) carried off the club gold medal, and made a really splendid climb, coming up very slowly; and, in spite of ominous wheel slip at times, made a clean ascent without assistance. J. G. Phillips (3½ Norton) and W. S. Jones (4 Triumph) also made creditable ascents with but little assistance.

Widnes M.C.

The club held a successful reliability trial on October 22nd for the Ireland rose bowl, which has been presented by Mr. W. Ireland, the vice-president. As the first man started rain fell heavily, which made the course more difficult, and out of fourteen entries only four finished. Results:

1, A. J. Bailey (4 Norton sc.), 97 marks; 2, T. H. Sandland (4 Triumph), 95 marks; 3, W. Patterson (4 Blackburne), 81 marks.

North Wales M.C.C.

On Saturday last the club held a speed hill-climb at Pen-y-Ball, Holywell. The event was very well supported, there being over sixty entries. The provisional results are as below:

CLASS I., 350 c.c.—1, J. Cooke (2½ New Scale); 2, W. Edwards (2½ A.J.S.); 3, J. W. Jones (3 Ivy).

CLASS II., 500 c.c.—1, E. G. Bannard (3½ Norton), fastest time of the day, 36s.; 2, G. E. Burns (3½ Sunbeam); 3, S. Ollerhead (3½ Norton).

CLASS III., 750 c.c.—1, E. G. Bannard (3½ Norton); 2, G. F. Burns (3½ Sunbeam); 3, S. Ollerhead (3½ Norton).

CLASS IV., 1,000 c.c.—1, E. G. Bannard (3½ Norton); 2, A. J. Brewin (8 Zenith); 3, G. E. Burns (3½ Sunbeam).

Cork and District M.C.C.

A very successful smoking concert was held on Wednesday last week, over seventy members and friends enjoying the excellent programme provided. The A.G.M. will be held on November 2nd, and it is hoped to arrange a winter programme, including, if possible, the exhibition of *The Motor Cycle* film. Fifteen new members handed in their names at the "smoker," which augurs well for next season.

RELEASE OF "THE MOTOR CYCLE" FILM.

Arrangements have now been made to exhibit *The Motor Cycle* film in London during the week of the Motor Cycle Show at Olympia. It will be shown twice daily at the Polytechnic Cinema, Regent Street, W., commencing on Monday, November 28th. Further details regarding the times that it will appear and prices of admission, etc., will be published shortly.

Applications from the clubs are pouring in and dates are being allotted as quickly as possible. We hope to announce in an early issue the names of the clubs which have been fortunate (and enterprising) enough to secure early dates.

The length of the film as it stands at present is 1,767 feet, and occupies just thirty minutes' continuous running. Before release, however, it is hoped to add another 400 feet, including scenes from the recent 200 Miles Race for light cars.

SURPRISE BRAKE TEST IN MIDLAND TRIAL.

H. C. Collins (3½ Norton sidecar) nearing the second tape in the brake test included in last Saturday's closed trial of the Sutton Coldfield and N. Birmingham A.C. Trial for the Shell and Sutton Cups.

PROP STANDS.

A Review of an Increasingly Popular Fitting on Solo Machines. By "Ixon."

SINCE motor cycles became popular, three methods of supporting a dismounted machine have been in vogue. Where the surroundings furnish no impromptu prop, as very frequently occurs, riders use the rear stand. The rear stand is essential for certain repair jobs, but is wholly unsuitable for a temporary support. It necessitates lifting the machine several inches, and many solo machines weigh 3 cwt., so that the physical effort is excessive. In handling the machine up, the owner must grip the

will ever regret his expenditure, or dispense with such a fitting in future.

The stand manufactured by the Pressed Products Manufacturing Co., of North Wharf, West Ealing, is an aluminium casting and not a pressing, as their trading title might imply. It weighs 12 oz. and sells at 8s. 6d. The aluminium lug is attached to the rear side footboard by three bolts, and the hinge is set at such an angle that the leg is vertical when in action. A novel feature is that the leg is non-telescopic, as the inventors consider

trigger is too small for footwork, but a touch of the finger will push the prop down, and the trigger immediately springs into a lock. On restarting, the operation is less easy, as the rider must hold the machine up with one hand while the other hand pulls the trigger out of its notch against the action of a strong spring. A telescopic leg will be fitted to the production model.

A design commendable in many ways is that protected by Mr. A. H. D. Alltree, of 279, Wilmslow Road, Fallowfield,

(4) Marketed by the M.A.P. Co., this stand weighs 4 oz. only.

(5) Designed by C. H. Morris, and simple in construction.

carrier, which is almost invariably very dirty. Thirdly, since the stand clip must be light, if it is to be disengaged easily, it often allows the stand to drop when the machine is in motion. Another method consists of propping the machine against a wall; in this position it is never too stable; it requires a little manœuvring into position; and some of the fittings will sooner or later get scraped and damaged by friction against the wall—control lever knobs, handle-bar grips, hooters, and the like. The third method—always employed when available by practised riders—takes the form of propping the machine by its footrest or footboard against the stone kerb of a street or the earthen kerb of a country road, viz., the edge of the turf bordering the macadam. As this last method is at once the easiest and the safest, it is naturally the most popular. You may often see a good roadman gauging the height of the road edge with his eye as he selects a place at which to pull up.

"Carry your Kerb with you."

The inevitable popularity of the new "prop stands" is that they render the last method of supporting a dismounted machine universally available. They make a motor cycle, so to speak, "carry its own kerb with it," as a brief study of the several devices described herewith will indicate. They are of very varying merit, price, and weight. Some of them are still obviously crude, and as yet in the experimental stage. I have tried them all, and find that a good device of this kind is one of the most pleasing gadgets one can fit to a pet machine, especially if its daily work entails innumerable stoppages. A week after purchase many gadgets strike a thrifty buyer as having been pure extravagances. No rider who invests in a good prop stand

there is a risk of a telescopic leg closing up when the weight comes upon it; so they prefer to produce legs of three different lengths, a range which fits all standard machines. As the illustration shows, the stand is toe-operated, a spring locking it on either side of a dead centre. My only criticism on this stand would be that aluminium is a somewhat brittle material from which to manufacture a prop.

The next stand illustrated herewith is produced by Mr. H. H. Bowland, of the Central Garage, Stockport, and weighs about half a pound. It is screwed under the footboard at right angles to the wheel track, and, when it is in the inactive position, it protrudes about an inch from the side of the footboard. The operating

Manchester, which is already in production, and will soon be obtainable in various modifications to fit any standard footrest or footboard. Its tip protrudes slightly behind the tail of the footboard when the prop is out of action. On stopping, the rider depresses the prop with his toe, leans the machine over towards him, whereupon the weight of the 'bus locks the prop in action. When the rider is ready to proceed, he merely tilts the machine back to the vertical, when the prop instantly flies up. A safety catch, consisting of a tiny trigger and notched washer, is provided for use when the machine is to be left unattended for a long period. It should be observed that this stand is mounted as near the weight centre as possible, and also far out from the centre line of the wheel track. These two points are probably vital. It is as nearly automatic in use as a stand can be, one touch of the boot toe being the sole control required in the double action of applying and releasing it. I can detect no fault in it.

Simple and Very Light.

The M.A.P. stand, marketed by the M.A.P. Co., of 24, Bullock Street, Birmingham, has now been on the market for some time. It weighs upwards of 4 oz., according to the length of its leg, and costs 5s. 6d. A touch of the toe knocks it down; another touch of the toe knocks it back again, and the spring pulls across a dead centre to hold it rigid when it is acting as a prop. It is plainly as light and simple as such a gadget can be. Perhaps it is almost too light for a very heavy mount, and the attachment may prove hardly strong enough for some ultra heavy machines. As the sketch indicates, it is held by a rectangular or L shaped bracket; a hole in one arm of

A telescopic stand, by Messrs. Taylor and Co., Southport.

Trop Stands—

the L threads over a footboard bolt or footrest spindle, and the other arm of the L bears against the underside of the foot support.

Mr. C. H. Morris, of 83, St. James's Road, Oldbury, Birmingham, propounds an altogether different type. As the sketch indicates, it is cheap to manufacture, is put in action by a touch of the foot, and flies back when the weight of the machine is taken off it. The weight will be negligible. On the other hand, I question whether the chain stay is the proper point of attachment. The weight of the machine centres far in advance of this point, and a strong wind or any other violent impetus might cause the

machine to pivot on the prop and fall over, with disastrous consequences to the footrests.

The stand shown at the bottom of the preceding page is made by Taylor's Garage, Southport. The telescopic leg is hinged to a split lug, which is readily bolted to the chain stay of a motor bicycle. On the T head of the leg is a notched collar, which may be locked by a small spring pedal in any of three positions, one being the "out of action" point, in which the leg lies snugly along the chain stay, whilst the other two notches give a choice of angle in the support position. I do not object to the weight of this stand, and the wide angle at which the leg swings out radially from

the track makes for stability, in spite of the rearward mounting of the prop. But the operation is not ideal, for a foot and a hand are employed in utilising the stand. It weighs rather more than the majority, viz., 2 lb. 4 oz.

Young as this accessory still is, it is already becoming hedged in by patents, and engineers who are attracted by its possibilities will do well to enquire what principles are already protected. Several inventors have met a cool reception at the hands of motor cycle manufacturers; but I think the new gadget is going to be very popular in 1922, and that ultimately it will become part of the specification of most first-class mounts, for its conveniences are very real.

CLUB COLOURS.

Twelve More Examples of Flags Adopted by Motor Cycle Clubs.

SINCE we illustrated the club pennons of four well-known clubs in our issue for September 15th, we have received many letters from club secretaries, in which they state that the general adoption of the idea is supported by their members. On this page we are able to give illustrations of a dozen more club flags, and next year, no doubt, many more clubs will adopt the flag scheme.

The Best Size.

As a general rule, the flags measure about 9x5in., which is not so large as the familiar red flag which so many Indian riders sport. The flag of the Wallington and District M.C.C., however,

Some clubs have badges in enamels to match the flags. The Taunton club's badge is a triangle, with a red, white, and black centre, while the centre of the Wallington club's badge is a black and white check.

yacht racing may be interested to learn that yachts fly pennons to show how many successes they have to their credit. A reader suggests that this idea would be popular with club members. We are afraid, however, that a long string of flags would be difficult to fly aboard a motor cycle, but perhaps the scheme could be applied by having tiny pennons with which to decorate the machine on gala days. In any case, every keen motor cyclist would like to decorate his room with such emblems of success.

Out of all the flags we have so far illustrated, only two deviate from the triangle. The Marlow and District M.C.C. flag is one of these, being a swallow tail; while

The Wallington and District M.C. and L.C.C. colours are black and white, without lettering.

Marlow and Dist. M.C.C. Cardinal red with yellow letters.

Rotterdam M.C.C. (Holland). Green and white, black lettering.

Ipswich and Dist. M.C.C. Red ground and yellow letters.

Claret, edged with royal blue are the colours of the Solihull Old Boys' M.C.C.

Yellow and black are the colours chosen by the Royal Dutch M.C.

is quite small (6x2½in.) and is made of silk. It has no lettering, but the black and white check is so distinctive that it is not necessary. This club extends the idea to its badge, which is a most artistic fitment finished in black and white enamels. The Taunton Club also has a badge in colours to match the flag; and again, both flag and badge are well carried out, the colours being red, white, and black.

The Sheffield and Hallamshire Club favours black and gold. Incidentally, this

club has had its colours for several years, and is one of the most enterprising clubs in the country. It has twice won *The Motor Cycle Cup* in the M.C.C. team trials, and advertises the fact on its notepaper. That shows the right spirit for a sporting club. It is an achievement to win an important event of this nature, for years past acknowledged to be the club championship, and it is not egotism to advertise the fact.

Apropos honours and club colours, those of our readers who know little of

the Folkestone and District M.C.C. favours a rectangular flag 8x4in.

Undoubtedly the best position to fix the flag on the machine is the front number plate or mudguard; a suitable clip is not a difficult matter to evolve.

In the meantime club secretaries are asking where they can obtain flags to their order and design. We understand Messrs. Eccles and Sherar, of 6, Ann Street, Edinburgh, and also Messrs. Good and Son, King William Street, London, E.C., specialise in this class of bunting.

Black and gold have been chosen by the Builth Wells M.C.C.

The Sheffield and Hallamshire M.C. also favours black and gold.

Peterborough M.C.C. Red and blue, with white lettering.

Folkestone and Dist. M.C.C. Dark blue with white device.

Taunton and Dist. M.C. and L.C.C. Red and white, black lettering.

Okehampton M.C.C. Another unlettered flag in red and black.

MIDLAND OPEN TRIAL

PHENOMENAL PERFORMANCE OF MR. W. B. GIBB, OF
GLOUCESTER, ON HIS

Douglas

M.C. and A.C. TROPHY

FOR BEST PERFORMANCE OF THE DAY.

"BICYCLING NEWS" TROPHY

FOR BEST PERFORMANCE OF ANY M.C. and A.C. MEMBER

"*Motor Cycling*" says:—"..... was very fast, but he was beaten by W. B. Gibb (3½ h.p. Douglas), who covered the 200 yards in 13 seconds from a standing start in bottom gear!"

This performance is really remarkable. There was only one Douglas among the 60 machines of all types; yet it carried off every prize for which it was eligible. It must be remembered that Mr. Gibb's machine was a standard 3½ h.p. Douglas, fitted with detachable, light car tyres, three-speed gear and clutch, and is the same machine on which he has won so many Hill Climbs, proving beyond all question that apart from its wonderful speed of 80 m.p.h., the Douglas is essentially a touring mount.

SECONDS
SECONDS

In solo and sidecar classes were gained by Mr. Hatton, on a 3½ h.p. Douglas.

ITALIAN CHAMPIONSHIP, CIRCUIT OF THREE REGIONS.

(369 miles).

(590 kilos).

ERNESTO GNESA FIRST.

This race was over a very arduous course, extremely long with mountain climbs, and not only did the Douglas win the 500 c.c., but it beat all the 1,000 c.c. machines in the TONALE HILL CLIMB, included in the race.

Victorious in strenuous long distance races, as these machines consistently are, confirms beyond a doubt the outstanding merits of the Douglas.

The new price of the Douglas Sports Model,
£130 complete with lamps, etc.

To be seen in most Douglas Agents' Showrooms.

DOUGLAS MOTORS, LTD., Kingswood, BRISTOL.

Terry's patent Spring Links

absorb bar vibration—stop wrist ache, and increase motor cycling comfort. When you fit the spring links, the front wheel kicks are not carried to the wrists. Thus the machine will glide over the roughest surfaces easily and smoothly at speed.

This stops sidecar bounce, and saves you the trouble of holding the sidecar down when you are running empty No. 978. Terry's patent check spring sidecar fitting. Very best quality workmanship, 5/- pair, from your Agent.

Suitable for all Bike Types.

Up to 2½ h.p. solo	12/6 pair.
2½ h.p. to 6 h.p. sidecar	15/6 "
"Douglas" 2½ h.p. only	15/6 "
"B.S.A." 4½ h.p.	15/6 "
"Enfield" 2½ h.p.	21/- "
"Enfield" 6 to 8 h.p.	24/- "

Order a pair from your own Agent. List post free

Herbert Terry & Sons Ltd.,
Manufacturers,
Redditch, England.
Est. 1835.

Have oil and petrol squirts close to hand. Clip them to the frame. Save time opening and closing tool bag. Very best quality. 4/6 each. From your Agent.

No. 864. Terry's Regd. Inflator Clips. Stops loss of pump. Wing bolt and nut prevents the pump shaking out or rattling. Enamelled, 2/- Plated, 2/6 pair. Dependable—because "Terry" quality all through.

No. 687. Terry's High-grade Kick-up Stand Clip. Best quality hardened and tempered STEEL Enamelled, 1/6 each. From your Agent.

Use Terry's "AERO" quality Valve Springs for pace and power.

THE REVELATIONS OF THE TRIALS

The wonderful successes in the recent A.C.U. SIX DAYS TRIALS of the NEW ROVER and CONNAUGHT Teams again brings to the notice the benefits to be derived from the "BONNIKEN." All these machines were fitted with this type of Speedometer, and the general opinion of the riders emphasises the assistance derived from the use of the Instrument, as the following extract from a letter will show. "All Connaught riders fitted a Bonniksen Speedometer and found them very satisfactory. My personal views on them are that they leave nothing to be desired. They helped me very much in keeping to scheduled times, and I relied wholly and solely on them for the speed test at Brooklands."

THE MOTOR CYCLE

Insurance Policy

Testimony

THIS space will be occupied each week with copies of letters from Policy holders who have made claims. Original letters may be inspected.

Dear Sir,
I am in receipt of your letter of yesterday's date enclosing cheque.....in settlement of my son's claim.

I take this opportunity of thanking you on his behalf for the prompt and business-like settlement, which I shall not lose sight of in furthering your Company's interest.

Yours faithfully,

The only Safe Test of Insurance is Claims. We settle Claims promptly.

BANCROFTIAN CO'S. GREAT SALE

FINAL REDUCTIONS.

FINAL REDUCTIONS

CLEARANCE LINES.

In consequence of our Head Depot, 64, Bishopsgate, coming down, and not having sufficient room at 78, Bishopsgate, we have decided to clear our stock, the value of which is about £20,000, regardless of cost. No reasonable offers will be refused for large parcels, as we must clear as much as possible of our stock within a short time. Everything for the motor cyclist in stock. We are advertisers in "The Motor Cycle" since its first publication. Our Sale is Absolutely Genuine.

Tyres. Drastic Reductions. All Tyres advertised by us are simply last year's stock. Although they are sold as clearance, they are as good as when they left the factories. We have no W.D. tyres. The prices are actually below cost. Limited quantity only. Must clear; buy now while they last. **Wood-Milne, Extra Heavy** 4-ply, 26×2½, 26/6; 26×2½, 27/6; 26×2½ to fit 2½, 29/6; 28×3, 32/6; 700×80, 37/6; 650×65, 35/-; 26×2½ Combination, 45/-. All clean and wrapped in original packing. **Pedley, 26×2½ 3-ribbed, 27/6. FORWARD PLUGS

Forward Plugs are widely used by Motor Cycle and Car Manufacturers, and are famous for their superior service and lasting qualities. They deliver full power to the engine, and stand up to years of hard service. Every insulator is tested for dielectric strength with a voltage from two or three times as high as the severest demands of actual use.

There is a special type of plug for every type of Motor—porcelain or mica insulators.

Send for list.

Motor Cycle Number Plates.

IT is an open secret that the authorities are urging an amendment of the present regulations affecting the size of motor cycle number plates. It is unlikely, however, that the motor bicycle number plates will be altered, but in the case of heavy sidecar outfits and three-wheelers coming under the motor cycle definition, some alteration will, in all probability, be made. The matter is one the necessity of which is being impressed upon the Ministry. It appears that several provincial chief constables have complained to the Ministry of Transport that, after dark especially, the identification number of a fast heavyweight sidecar outfit or three-wheeler is practically illegible.

As our readers are aware, under the existing regulations any vehicle which weighs less than 3 cwt. may carry motor cycle number plates. By the old Act of 1903, vehicles which weigh more than 3 cwt. must use full-size number plates. Fortunately, this regulation has not been strictly or generally enforced up to the present, but proceedings have been taken against owners of heavyweight three-wheelers, and many of these have been compelled to use the larger size identification marks.

The present position is a little indefinite, but, owing to the pressure brought to bear by the police in various parts of the country, the Ministry of Transport is determined to do something to render the identification marks on the particular types of vehicles referred to more legible. Exactly what form these alterations will take has not yet been decided, but motor cyclists must be prepared for the introduction of a new form of legislation which will certainly entail the carrying of larger numbers, and may also probably entail the necessity for these to be illuminated at night.

As the law stands at present, vehicles registered as motor cycles may either have their front or back numbers illuminated, but it is considered by

those in authority that the front number illumination is, generally speaking, ineffective, and we should not be at all surprised to find that all mechanically-driven vehicles, of whatever size or power, will have to have the tail light so arranged that the rear number plate is adequately illuminated.

While not wishing to appear hypercritical, we cannot help thinking that this particular phase of activity is one of those needlessly surviving pin-pricks from the days of the "red flag."

Quarterly Licences.

WE made reference, in the last issue of *The Motor Cycle*, to the fact that in the near future motor cycle licences may be taken out quarterly. As we then forecasted, these short-period licences will not be issued for less than three months, and at the rate of about one-third more than an exact quarter of the amount at present payable; for example, a motor cyclist taking out a licence for a machine on which the annual tax is £4 will have to pay £1 5s. for a quarterly licence, and a motor cyclist whose machine bears an annual tax of £2 10s. will pay 15s. This privilege has been enjoyed by car owners, of course, since the introduction of the new motor taxation regulations in 1921, and it has been very satisfactory to all affected by its provisions—new cars being ordered and delivered fairly evenly throughout the year, as prospective owners were not deterred by having to disburse an amount of tax disproportionate to the period covered by the payment.

There is no doubt that these short-period licences will be heartily appreciated by private owners, and that they will be a great boon to the motor cycle industry, as they would encourage the purchase of machines towards the end of the year, whereas at present the obligation to pay half the licence duty on a machine purchased at the Show must tend to influence would-be purchasers to wait until the New Year.

Depreciation.

IN motoring papers and in trade circles, it is rather assumed that universal poverty and heavy taxation are the chief obstacles to the revival of lively sales in the motor industry. I may be wrong, but the testimony of my acquaintances, coupled with my own experience, rather suggests that quite unparalleled depreciation is the worst evil of all. Taxes are certainly large, but they bear a very small proportion to the expenditure involved in commencing a motoring career, or in a change of motor. We may be poor, but quite a lot of us can still find the money for a car or a sidecar or a bicycle. What is holding up thousands of sales is the knowledge that, when a man puts down his money for a new motor, an enormous slab of it is instantly gone beyond recall. Should one wish to resell next mornning, the loss on a new car may run into hundreds, and even on a modest bicycle it may tot up to £50 in extreme cases. Such depreciations are inevitable just now. Prices have been tumbling, and have accustomed buyers to ridiculous prices. Over-production has been rife. New models are being introduced, and rendering current patterns obsolete in a sentimental sense, if not from a practical standpoint.

And the Remedy.

A PERMANENT remedy can only come when prices are recognised to be stable, when design becomes less fluid, when supply and demand balance more evenly. At the moment, in view of the vast amount of unemployment, it is the obvious duty of any Britisher who needs a commodity, and can afford to buy it, to place his order instantler. That is his duty to the nation; and if everybody who is contemplating the purchase of some valuable commodity ultimately, did it at once, trade would revive very appreciably, and unemployment would shrivel quite a lot. His duty to himself is to buy very carefully. For example, my 1922 bicycle is being ordered this week. I shall carefully avoid all firms which are likely to make profound changes of design, firms which are likely to go out of business and those which do not enjoy the soundest technical reputation: I should regard myself as almost a criminal if I did not buy at once. I should regard myself as a fool if I bought rashly. I may sacrifice a pound or two by not making shift with my old 'bus for another year; but I can just afford a new one, and it will be my small contribution to improving the lot of many

who are far worse off than myself. I appeal to all patriotic motor cyclists who have a cash balance to go to the Show *determined to buy*. When several million people are beset by a keen anxiety about their bread and butter, it is a crime for the wealthier classes to sit tight in the hope of saving a pound or two later, on.

The Challenger Self-sealing Tube.

I DO not handle gadgets in these pages unless they are of special interest; and anything which tackles the universal puncture nuisance comes in that category. Therefore, a few weeks ago, I wrote in a vein of moderate encouragement about the Challenger self-sealing tube. A correspondent complained that his tubes of that make merely postponed the hour of repair, as the sealing was never absolute; and I gave his criticism equal prominence. Since then I took the tube out of my wheel, blew it up to a measured pressure, kept it in my den, and stabbed it daily with many sharp instruments, ranging from nails to the fat marlinspike on a Scout knife, which is a good $\frac{1}{4}$ in. in diameter. At each stab the layer of mastic inside the double tread spat out a tiny dab of itself, and sealed the hole within three seconds and completely. Subject to the obvious drawbacks of its construction, I think there is no doubt that this tube is effective. It seals all medium-sized holes thoroughly, and it can be patched when a huge gash is sustained. On the other hand, there is a slight loss of resiliency, and a substantial increase in cost. Expenses would mount high in the case of a rider who is in the habit of destroying tubes at frequent intervals by riding covers to destruction, but few of us are such idiots as to do that; and, given reasonable attention to covers and fitting, the life of an inner tube resembles that of Methuselah.

Non-startitis.

THE other night I found myself in an impromptu rural garage where a small crowd had garaged their motors whilst they watched Charlie Chaplin in "A Dog's Life." A trio of the company spent about a quarter of an hour getting away. Jones had a single-gear belt-driver, which couldn't take the slope up to the road from cold. Smith had a chain-and-sprocket starter on his cycle car, and, despite wild leaps into the air, he couldn't get enough leverage to rouse a frozen engine swamped in gluey oil. Brown had an air-cooled car, the handle of which revolved

Occasional Comments.—

backwards at speed for umpteen revs. whenever anybody could pluck up the courage to tweak it. Not first-class propaganda for the year 1921, was it? A crowd of loungers was most unpleasantly impressed. In each case the root trouble was that the carburettors were too simple. One and the same setting was supposed to serve for (1) tickover, (2) starting from cold in summer, (3) starting from cold in winter, and (4) starting when warm in any weather. There is a marked tendency both in car and cycle carburettors to add extra controls for emergency use, such as mixture regulators, air stranglers, and the like. This is all to the good. In their absence a slight retuning of the carburettor should be performed when the cold months approach.

How not to do it.

BENZOLE Villa (my private address) is situate far from the madding crowd, partly because rents are low, partly to prevent the Editor from nabbing me for unwelcome stunts out of office hours. Not since I signed the lease has any motor cycle trial penetrated my rural fastness until the other week, when one of our premier clubs unearthed two or three of my pet pimples, and consequently defiled our secluded roads with yellow ochre, burnt oil, and horrid noises. Hodge, Mrs. Hodge, and perhaps even more particularly Miss Hodge and Master Hodge, were naturally excited. A day or two before, several bright knuts

tacked cardboard arrows to some of our pet fruit trees, besides sampling the local malt and cider in the intervals of their exertions. Several of our bourgeois and knutty residents, who had thought tepidly of buying motor cycles, opined it wouldn't be half bad fun to watch "the motorists" clambering up the gamekeepers' paths and dried up rivulets which these lunatic invaders had mistaken for roads. Timid enquiries made by daring *habitués* of our several taps had elicited the haughty information that Saturday was the great day. Saturday dawned. The village took a holiday, and assembled themselves at various grandstands about 8 a.m. The first man arrived about 2.45 p.m., by which time the sightseers had grown weary, and had mostly tramped off to the pictures at Slushington, or were trying for the *n*th time whether a Government reject pick would make any impression on their calloused allotments.

When a club runs a trial in unfrequented areas, why does not its secretary at least placard the local pub, somewhat as follows:

200 MILE MOTOR CYCLE TRIAL FOR THE STIGGINS GOLD CUP.

THE RIDERS WILL CLIMB (?) SO-AND-SO HILL.

(Drown in this splash, slither down that precipice, etc., etc., at — p.m.)

THE FOLLOWING ARE COMPETING, AMONGST OTHERS:
(Here mention any record-holders, race winners, etc., giving their numbers.)

HILL-CLIMBING IN CUMBERLAND.

A fine view from old Garth Hill, showing the snow-capped Skiddaw. The little 2½ h.p. Velocette, with sidecar, made the star ascent at the Cumberland M.C.C. sporting half-day meeting described last week; it is seen just after passing the lower hairpin.

Road Tests of New Models

THE 500 c.c ZENITH-BRADSHAW.

THE Bradshaw-engined model of the famous Zenith was obviously staged in a somewhat unripe condition at the 1920 Olympia, and it has only lately reached its full bloom. But a week's trial of a brand new production model shows that a notable addition has been made to the list of first-class sporting mounts. We use the word "sporting" advisedly, because no good motor cyclist is likely to affix a sidecar or even to attempt unrestricted touring with a specification which employs belt drive and is limited to a bottom gear of about $6\frac{1}{2}$ to 1. Taking these limitations for granted, it would be difficult to name a more delightful machine. Two remarkably distinctive features clamour for admiration before points common to more conventional designs are discussed. The first is the quite unusual mechanical silence. A variable pulley gear is, of course, as nearly silent as a transmission can be; in this case the silent drive is flanked by a notably quiet engine.

The Oil-cooling System.

It would seem that oil-cooling may remove a reproach hitherto regarded as inalienable from air-cooled engines. No matter how carefully such engines have been designed and built, they have always emitted a tinny rattle, due to the resonance of a naked cylinder

barrel. On water-cooled engines this resonance is dulled by the jacket. - On oil-cooled engines it is damped almost out of existence by the triple barrier of the oil-mist, the air space, and the crank case wall. A similar silence is observable with the oil-cooled engine designed by Mr. Bradshaw for the new Belsize car. In the second place, the removal of all anxiety about lubrication is a great boon. The tank top

carries no excrescences except the petrol filler cap; there is no hand pump, no sight feed, no visible oil pipe, and, consequently, no green stains. The only tell-tale consists of a rise-and-fall bobbin on the crank case; this betokens the action of a simple gear pump, with which no trouble

need be apprehended. Provided the rider has verified the presence of sufficient oil in the crank case before leaving home, he can ride all day without any lubricating anxieties, and that is without a doubt a big consideration.

A Cool Running Engine.

In practice there do not appear to be any drawbacks to the new method of cooling an engine, by submerging its cylinder barrels in the crank case. Our test engine was brand new, and it kept cool enough to meet every test we could invent to torture it, including five miles of full throttle on bottom gear

SPECIFICATION.

ENGINE: Bradshaw, o.h.v. flat twin, 68×68 mm. (494 c.c.)

LUBRICATION: Gear pump.

GEAR: Zenith-Gradua variable pulley.

TRANSMISSION: Belt.

FRAME: Rigid.

FORKS: Druid.

TYRES: 26×2½ in.

Road Tests of New Models—

ahead of a following wind. We have known a few new engines which kept cooler, but it was impossible to make it pink or pre-ignite under the most brutal treatment. Neither could a plug be induced to soot up by wild scraps up steep hills, followed by cautious descents of the reverse incline with the throttle shut. This latter test was confirmed by the fact that the oil consumption was too trivial to admit of measurement in a week, signifying that very little oil enters the combustion chambers. The only criticisms which can be passed are that the outside of the crank case does not keep spotlessly clean, though the leakages are slow and small; and that the insides of the pistons are not easily reached for decarbonisation purposes. A much longer test would be required to verify the amount of oil which becomes charred on the interior of the pistons in prolonged running; the Zenith works' experience suggests that the engine will easily run for a season before the insides of the pistons need be exposed—the engine must be taken to pieces for this to be done, though the detachable heads permit the combustion chambers to be cleansed very rapidly and easily.

5 to 65 m.p.h. on "Top."

On the road the machine is simply charming. It starts up instantaneously, is capable of from 5 to 65 m.p.h. on top gear, evinces splendid acceleration on the lower ratios, and runs at about 72 m.p.g. when

The belt transmission and the silent and smooth running engine make the flat twin Zenith-Bradshaw an ideal solo mount.

ruthlessly "hogged," greater economy being possible at a slower speed. With a 500 c.c. engine and a top gear of $3\frac{1}{2}$ to 1, speed can be obtained without resorting to high revs., and a smoother running "hogbus" would be difficult to find. If revs. are utilised, as they must be up very steep hills when the bottom gear is higher than a conventional middle, no vibration arises, for the engine is well balanced. Many air-cooled engines emit a distressing

mechanical scream when they are freely revved, but the crescendo of the exhaust remains the chief—indeed, almost the only—noise of the Zenith-Bradshaw, when it is being pushed.

With a 500 c.c. engine and a top gear of $3\frac{1}{2}$ to 1, speed can be obtained without resorting to high revs., and a smoother running "hogbus" would be difficult to find.

A fast machine requires good steering, good springing, and good brakes. The new Zenith frame is excellently balanced, and we could not wring the least symptom of a wobble out of it at a speed estimated at 65 m.p.h. in the absence of a positive meter. The saddle is so well insulated by the makers' special spring mounting that jars from the rear wheel are only felt on really atrocious going.

Readers who lament the decease of the old-fashioned belt-driven sports mount should not fail to examine the Zenith-Bradshaw. It offers a better performance than its predecessors with a tremendous advance in road manners and refinement, although it weighs more than they did, and has a somewhat more complicated power unit.

The $3\frac{1}{2}$ h.p. flat twin Zenith, fitted with the Bradshaw 500 c.c. oil-cooled engine.

100 MILES ROAD RACE IN SOUTH AFRICA.

Eastern Province M.C. Club's First Big Event under T.T. Conditions a Signal Success. Winner Averaged over 60 m.p.h.

THREE hours of thrills was the reward of the 10,000 spectators who distributed themselves all round the twenty-mile Kragga Kama circuit, near Port Elizabeth, to witness the Eastern Province M.C.C. 100 mile road race on October 3rd.

It was a handicap race, the limit man being Germon on a 211 c.c. Cedros, and the scratch L. Walsh on a 1,189 c.c. Indian, who retired with tyre troubles. The winner proved to be W. Wilson (7-9 Indian), who covered the course in 1h. 39m. 10s.=60.5 m.p.h., with D. Brink (2½ A.J.S.) second, 1h. 59m. 59s.=50 m.p.h.

Five Twenty-mile Laps.

The race attracted entries from various centres of the Union, and was decided over a circular course of twenty miles, which the competitors had to traverse five times. The surface of the road, but for about a furlong of veldt, was perfect, but on some of the bends it was necessary to exercise the utmost skill in riding and controlling the machines to negotiate the course at speed. There were a few spills—fortunately, none of them serious—and the race was run off without a hitch.

There were twenty-two starters, as follows:

Rider and Machine.	C.C.	Handicap.
Germon (Cedros)	211	38 min.
Mayhew (A.B.C.)	400	15 "
V. D. Schyff (A.B.C.)	400	15 "
Pyott (A.B.C.)	400	15 "
Brink (A.J.S.)	348	17 "
Kruger (Triumph)	499	11 "
Seale (Triumph)	499	11 "
Bell (Scott)	528	9 "
Pashley (Scott)	532	9 "
Ball (Triumph)	550	9 "
Collett (B.S.A.)	557	9 "
Landry (Triumph)	499	11 "
Steers (Indian)	596	7 "
Paton (Indian)	596	7 "
Braybrooke (Norton)	499	11 "
Wild (Harley-D.)	989	2 "
Stroebel (Indian)	997	2 "
Brittan (Indian)	997	2 "
Peterson (Harley-D.)	989	2 "
Lilienfeld (Harley-D.)	989	2 "
Wilson (Indian)	997	2 "
Walsh (Indian Police)	1189	Scratch

THE VICTOR AND THE RUNNER-UP.

W. Wilson, winner of the race on a 7-9 h.p. Indian, and D. Brink, 2½ h.p. A.J.S., congratulating each other after the strenuous ride. Both performances were notable—the average speed of the winner being 60.5 m.p.h., and that of Brink 50 m.p.h. The latter rode a side-by-side valve model.

The handicaps were allotted on power of machines and the competitors' performances during the past twelve months.

Germon on his 2¼ h.p. Cedros was the first man to get away, and was followed by the remaining competitors at intervals. The acceleration of the Scotts, A.B.C.'s, and A.J.S. was terrific, and pleased the crowd. Before the scratch man left, Germon had covered a lap, and arrived with his engine four-stroking very badly, and he abandoned the race. Walsh (8-10, Police-Indian), the scratch man, was sent off, amidst cheers from the crowd, in pursuit of the field. Mayhew (A.B.C.) soon made his appearance, and had put up a very fast round. He was closely followed by Dr. Pyott (A.B.C.) and Brink (A.J.S.). The latter was going at a terrific speed, and was overhauling the earlier starters in fine style.

Wilson (7-9 Indian) had picked up several places, and roared past the depots

at well over 70 m.p.h. Three men fell out during the first lap. Peterson (Harley) had a very narrow escape from being precipitated over the bridge at Frames Drift, and damaged his machine badly and was unable to continue. Braybrooke (Norton) retired with a burst tank.

Good Racing.

By the end of the second lap the pace had begun to tell, and many of the machines were getting "tired." Mayhew (A.B.C.) was leading, while Brink (A.J.S.), Kruger (Triumph), Wilson (Indian), and Lilienfeld (Harley) were hot in pursuit. Walsh, the scratch man, after putting up a record lap, had the misfortune to have tyre trouble.

Mayhew put in at the depot after the third lap to replenish with petrol and kept his engine running. Some petrol was spilled on the machine and immedi-

From left to right: D. Brink (2½ A.J.S.), who came in second, J. L. Kruger (3½ Triumph), and L. T. Scale (3½ Triumph).

Two A.B.C. riders, L. E. Mayhew and I. H. van der Schyff. The former machine unfortunately caught fire on the third lap.

100 Mile Race in South Africa.

ately the whole outfit was enveloped in flames, which were fortunately extinguished after a short while with sand before much damage was done. Through this misfortune Mayhew was compelled to abandon the race.

Excitement grew tense when Brink (A.J.S.) started on the last lap with about a minute in hand from Wilson (Indian), while Lilienfeld was three minutes later, Ball and Kruger being close in attendance.

Ever long white flags waved frantically, the officials and police striving hard to keep back the dense crowds at the winning post. A speck hove into sight on the horizon, and the roar of Wilson's Indian became more and more loud, and in an instant he flashed over the winning line at well over 70 m.p.h. Brink (A.J.S.) had the misfortune to have a toss during the last lap, which impaired his chances of winning considerably. Much shaken, he pluckily remounted and continued the race, to finish second nearly four minutes after the winner. Lilienfeld followed three minutes later in third place.

A Pre-war Machine.

One of the surprises of the race was the performance put up by Kruger, of Bloemfontein, on a seven-

year-old Triumph, albeit of the racing breed. When he started away on his highly-g geared single-speed mount it seemed as though the tortuous and hilly nature of one or two portions of the course would make his lack of a lower ratio fatal to any chance of success. Despite this disability, however, he rode a most creditable race, and actually was the fourth man to finish, although he had to be disqualified on account of taking in petrol otherwise than at his depot when he ran short. He had suffered a damaged hand in practising the previous day, and rode with it well swathed in bandages.

The following nine finished:

Rider and Machine.	Start. min.	Time.		
		h.	m.	s.
1. W. Wilson (7-9 Indian)	2	1	39	10
2. D. Brink (2 $\frac{1}{2}$ A.J.S.)	17	1	59	59
3. E. Lilienfeld (7-9 Harley-D.)	2	1	48	6
4. A. C. Ball (3 $\frac{1}{2}$ Triumph)	15	2	25	35
5. L. T. Seale (3 $\frac{1}{2}$ Triumph) ...	15	2	28	10
6. F. Pashley (3 $\frac{1}{2}$ Scott)	15	2	27	0
7. N. Collett (4 $\frac{1}{2}$ B.S.A.)	15	2	27	3
8. E. W. Steers (5 Indian)	13	2	44	5
9. E. Landry (3 $\frac{1}{2}$ Triumph) ...	14	3	0	0

The fastest lap was made by the winner, who covered the course on his last circuit in 18m. 49s. = 63.8 m.p.h. Brink's (A.J.S.) fastest lap was his first, 22m. 55s. = 52.3 m.p.h.

**IN THE 100 MILE HANDICAP RACE IN SOUTH AFRICA.**

Except for a short distance the surface of the road was good, the worst portions being at certain corners. The illustration on the left depicts A. Pashley (Scott)—whose cornering incidentally was a feature of the race—on a bad stretch. A. Steers (4 Indian) is shown on the right also negotiating rough going at a bad corner.

**SPRINGING WITH CONSTANT TRANSMISSION TENSION.**

TO maintain approximately constant transmission centres has satisfied most designers of motor cycle rear springing systems, but Whitelock's frame, which we illustrate, gives no variation whatsoever in belt or chain tension. This is attained by mounting the rear wheel axle in guides (of course, with suitable bearings), which are struck at a radius to the countershaft centre. Auxiliary rear stays pivoted at the rear of the gear box actually support the wheel, and, being horizontally slotted, allow it to follow the radius guides. These stays are in turn linked to another pair of auxiliary stays, which are controlled by enclosed spiral springs (or, alternatively, laminated springs).

The principle is certainly ingenious, and, if carefully carried out, particularly

Constant transmission tension is attained in this spring frame by carrying the wheel in a slotted guide, struck at a radius to the countershaft.

at the bearings for the axle, the design should certainly be worth trial.

Mr. A. Whitelock, 2, Carlton Terrace, Thirsk, Yorkshire, is the inventor.

FACILITIES FOR A.G.U. MEMBERS AT OLYMPIA.

THE Auto Cycle Union has made arrangements for the convenience of its members attending the Motor Cycle Exhibition at Olympia. The Princes Rooms will again be reserved for the exclusive use of A.C.U. members throughout the week, and will doubtless provide the much-appreciated facilities enjoyed by members of the Union in former years—the lounge, writing room, and cloakroom accommodation contained in them being much valued.

Ilkley M.C. and L.C.C. (Bingley Section).

There were 137 entries, including several well-known riders, for the thirty-four events in the gymkhana held on the 29th ult. Local charities benefited to the extent of over £5.

Uxbridge and District L.C. and M.C.C.

Something of a novelty in the form of a "village-finding competition" was held on October 30th. Results: 1, R. Strainge (2½ Douglas); 2, R. Donaldson (¾ Norton).

Stourbridge and District M.C.C.

Taking the form of a paper chase, the last outdoor event of the year was held on Saturday, October 29th. The awards were given as follows: Gold medal, J. Bowyer (5-6 Rover sc.), 3m. error; silver medal, Miss Blackford (4 Norton sc), 5m. error.

The annual dinner will be held at headquarters on Saturday, November 19th, at 7.30 p.m. Prize distribution 9 p.m. Tickets are now available from the secretary, and it is hoped that all members will attend.

Hinckley and District M.C.C.

A very successful smoking concert in connection with the above club took place on Monday evening of last week in the Masonic Hall, Union Hotel, Hinckley. The attendance was good, and the musical programme was very much appreciated. Mr. K. S. Topping, hon. sec. of the East Midland Centre A.C.U., kindly took the chair, assisted by the Rev. J. M. Philpott, local consul A.C.U., the former giving a broad outline of the advantages of affiliation under the Auto Cycle Union, and the latter giving the details of the various schemes. Ten new members were enrolled.

Stalybridge and District M.C.

Speed trials were held on the 30th ult. over a quarter of a mile distance on a private road; but, on account of the short flying start, no exceptionally fast times were recorded. Fastest time of the day was made by B. Watts on a 2½ h.p. Dot-Jap. There were sixty competitors. Results:

350 c.c. SOLO.

Flying Start.—1, B. Watts (2½ Dot-Jap), 17½s.; 2, G. Porter (2½ Excelsior), 22½s.
Standing Start.—1, B. Watts (2½ Dot-Jap), 24½s.; 2, G. Porter (2½ Excelsior), 31½s.

550 c.c. SOLO.

Flying Start.—1, B. Watts (2½ Dot-Jap), 15s.; 2, H. Fellows (4 Triumph), and A. Margrave (4 Triumph), tied, 16s.
Standing Start.—1, B. Watts (2½ Dot-Jap), 20s.; 2, E. Barnes (4 Triumph), 22s.

UNLIMITED SOLO.

Flying Start.—1, E. Barnes (4 Triumph), 15½s.; 2, A. Margrave (4 Triumph), 16s.
Standing Start.—1, B. Watts (2½ Dot-Jap), 20½s.; 2, E. Barnes (4 Triumph), 21½s.

PRE-WAR MACHINES.

Flying Start.—1, J. W. Hamer (3½ Rudge), 17½s.; 2, W. Hoyle (3½ Triumph), 17½s.

SLOW RACE. KNOCKOUT COMPETITION.
1, F. Wagstaffe (4 Humber sc.); 2, G. Topp (3½ Bradbury sc.).

Surrey M.C.C.

Provisional results of the recent speed trials are as under. The course was just under half a mile, and about twenty yards was allowed for a flying start. Fastest time of the day worked out at 55 m.p.h., this honour being shared by L. J. Mitchell (8 Zenith) and W. P. Wiltshire (8 J.A.P.). Results:

350 c.c. SOLO (Formula).—1, R. P. Robinson (2½ Wolf), 38.7 m.p.h.; 2, G. J. Feeny (2½ Triumph), 34.7 m.p.h.
350-600 c.c. SOLO (Formula).—1, G. W. Ralph (3 A.B.C.), 48.6 m.p.h.; 2, G. H. Williams (3½ Rover), 47 m.p.h.

OVER 600 c.c. SOLO (Formula).—1, R. Hopkins (6 Matchless), 52.2 m.p.h.; 2, W. P. Wiltshire (8 J.A.P.), 54.2 m.p.h.

ANY MACHINE.—Formula: 1, G. W. Ralph (3 A.B.C.), 44.6 m.p.h.; 2, R. P. Robinson (2½ Wolf), 39.1 m.p.h. Time: L. J. Mitchell (8 Zenith), 55 m.p.h. and W. P. Wiltshire (8 J.A.P.), 55 m.p.h., tied; 3, T. G. Meeten (7-9 Rudge), 54.6 m.p.h.

1,500 c.c. PASSENGER MACHINES (Formula).—1, F. N. Edney (7 Indian sc.), 47.6 m.p.h.; 2, L. G. Willson (6 Bradbury sc.), 53.8 m.p.h.

Barrow and District M.C.

Fastest time of the day at the club's recent hill-climb was made by H. Jackson (3½ Sunbeam) after a tie with J. G. Bethwaite (3½ Norton). There were 100 entries and about 1,000 spectators. Results:

CLASS 6.—1, S. A. Marks (2½ Diamond); 2, I. S. Parker (2½ Velocette); 3, W. B. Dall (2½ Omega).

CLASS 7.—1, S. A. Marks (2½ Diamond); 2, B. Hill (2½ Velocette); 3, W. B. Dall (2½ Omega).

CLASS 8.—1, J. Whalley (2½ Massey-Arran); 2, S. A. Marks (2½ Diamond); 3, B. Parkinson (2½ Douglas).

CLASS 9.—1, B. Parkinson (2½ Douglas).

CLASS 10.—1, H. Jackson (3½ Sunbeam); 2, I. G. Bethwaite (3½ Norton); 3, H. Baxter (3½ Norton).

CLASS 11.—1, H. Baxter (3½ Norton); 2, H. Jackson (3½ Sunbeam); 3, I. G. Bethwaite (3½ Norton).

CLASS 12.—1, H. Baxter (3½ Norton); 2, H. Jackson (3½ Sunbeam); 3, J. Whalley (2½ Massey-Arran).

CLASS 14.—1, H. Jackson (3½ Sunbeam); 2, H. Baxter (3½ Norton); 3, A. Hawkins (4 Triumph).

CLASS 16.—1, M. Parkinson (2½ Diamond); 2, J. Atkinson (2½ Velocette); 3, W. B. Dall (2½ Omega).

CLASS 17.—1, G. Roberts (3½ Norton); 2, W. MacKenzie (3½ Rover); 3, D. Channiol (3½ Sunbeam).

CLASS 18.—1, W. MacKenzie (3½ Rover); 2, J. Morrison (3½ P. and M.).

TO CLUB SECRETARIES.

"The Motor Cycle" Film will shortly be available for loan to enterprising clubs who are keen to make their winter social events a success. This exclusive film takes about forty minutes to exhibit, and the programme includes scenes at the Junior and Senior T.T. Races, the 500 Miles Race, the Six Days Trials, and the Grand Prix Car Race. Club secretaries should write to the Editor (Film Department), "The Motor Cycle," Coventry, suggesting two or three alternative dates, preferably in January or after.

Lewes and District M.C.C.

The club concluded its summer programme on October 23rd in the form of a hill-climb near the Dyke, Saddlescombe. Rain marred the competition, but the events were well competed for. Results:

350 c.c. CLASS.—1, E. Jenner (2½ Royal Ruby), 24s.; 2, L. P. Greenwood and G. E. Stacey (both 2½ Verus), tied, 26s.

TWO-STROKE CLASS.—1, Miss N. Dunford (2½ Sirrah), 30½s.; 2, W. J. Hylands (2½ Verus), 41½s.; 3, D. Stacey (2½ Sirrah), 46s.

600 c.c. CLASS.—1, C. Volk (3½ Sunbeam), 18s.; 2, W. H. Sheraton (3½ Norton), 22½s.; 3, E. Jenner (2½ Royal Ruby), 23s.

The special prize given by Messrs. J. B. Brooks and Co. for best supported class went to the winner of the 350 c.c. class.

Ilkley M.C. and L.C.C.

With four observed hills and two water-splashes over a sporting course in Wharfedale, Washburndale, and Nidderdale, the autumn reliability trial, held on October 23rd, produced some excellent riding. One of the observed hills was the famous (or infamous) Middle Tongue, in Nidderdale, which climbs from Beverley to the top of Greenhow Hill, which probably has never before been included in any reliability trials for passenger machines. There was only one failure on this hill, and that with a solo machine. The water-splashes were made difficult on account of the heavy rains the previous day. Altogether, there were eleven checks, and so close was the competition that it was only by reference to the secret checks that the winner could be decided. The first place went to W. Moore (3½ Scott), with an absolutely clean sheet. A. R. Naylor (3½ Sunbeam) was second (total error 45s.), and W. Bradley (7-9 Indian) was third, with a total error of 2m. 20s.

South-eastern Centre A.C.U.

Mr. E. Featherstone, treasurer of the Western Centre of the A.C.U., a member of the General Committee of the R.A.C., and of the Competitions Committee of the A.C.U., attended at Taunton on Saturday, October 22nd, to meet representatives of the local motor cycle clubs for the purpose of forming a South-western Centre of the A.C.U. Mr. C. C. Harvey, Exeter, presided, and representatives were present from five other clubs, whilst two other clubs sent proxies. Following an address by Mr. Featherstone, setting out the advantages of the A.C.U., and also that of a local centre, it was decided to form a South-western Centre, consisting of the following clubs: Bridgwater, Barnstaple, Exeter, Taunton, Tiverton, Yeovil, and Weston-super-Mare. The following officials were appointed for the local centre: Hon. secretary, Mr. Herbert T. Kite, Taunton; hon. treasurer, Mr. A. M. Knill, Exeter; chairman, Mr. W. E. Treloggen, Tiverton; and vice-chairman, Mr. A. J. Hill, Barnstaple. The delegate to the A.C.U. will be appointed at the first meeting of the Board of the Local Centre.

Quick Action Sidecar Stand.

EVERY sidecar should possess a sidecar stand; but, unfortunately, there are many attachments at present on the market lacking this convenience. The Lyndon fitment is designed to fill this gap, and differs only from the conventional article in a very ingenious quick-action locking arrangement. When not in use, the prop is held firmly in the horizontal position, and a half-turn of the small tommy-bar allows it to drop into action as a stand, when it is again locked.

General arrangement of the bearing portion and locking device on the Lyndon sidecar stand.

Lyndon and Holt, 25, Windsor Street, Leamington, are the makers.

Acetylene to Electric Conversions.

THERE are a good many users of acetylene lamps who are not anxious to take the trouble of keeping these in order merely for the sake of a few short journeys in lighted streets; and for riders using their machines under such conditions, Messrs. Wates Bros., of 132, Charing Cross Road, W.C.2, have

Wates Bros. acetylene to electric lighting conversion set.

introduced a lighting set consisting of a bulb and holder suitable for inserting in place of the ordinary acetylene burner of the head lamp, a tail lamp, and an excellent battery in an acid-proof case intended to take the place of the acetylene generator. When much night riding is done, a spare accumulator is recommended.

For Miniature Engines.

Some idea of the size of the new, "baby" Runbaken plug for cycle attachment units may be gathered from the picture, which shows it alongside a standard plug. The price is 5s. 6d. (The Runbaken Magneto Co., Ltd., Cheetwood Lane, Manchester.)

Valve Grinding Made Easy.

Convenience of operation is the chief feature of the Jones valve grinding tool. The bevels are of gunmetal, and the spindle cast steel, hardened and tempered, and adjustable to different lengths. (A. J. W. Jones, 10, Springfield, Fencham Road, Erdington, Birmingham.)

A Neat Acetylene Lighting Set.

Owing to its clean outline, the new F.R.S. "streamline" acetylene head lamp approaches an electric set in neatness. (F.R.S. Lamps, Beam Works, Vere Street, Birmingham.)

Facilitating Valve Removal.

VALVE or valve spring removal is made easy with the device shown above, which is to be marketed as the Stoakes valve spring cage and washer by E. Stoakes, 218, Soho Hill, Birmingham. The washer must be fitted permanently.

Stoakes's valve spring cage.

Electrical Timing Apparatus.

SPEED events are so popular with the clubs nowadays that a simple electrical timing apparatus, such as the one under review, will be of wide interest. The apparatus is quite portable, and is carried in a polished mahogany lock-up case, only 11x9x3½ in., which contains a starting and finishing device, telephones, and battery; it weighs 6 lb. complete. Timing is effected by a cotton thread

The Reader timing apparatus.

stretched across the road, which the competitor breaks as he passes. The battery is an ordinary flash lamp type, and works both the timing instrument and the telephones quite well over a distance of a mile. An ordinary stop watch is used, but is not touched by hand throughout the competition. The apparatus is marketed by the Reader Electrical Co., 56, Northgate, Wakefield.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

WHICH IS THE WORLD'S BEST SOLO MACHINE?

Sir,—I should very much like to endorse Mr. N. Williams's remarks regarding the Stanger as one of the world's best motor cycles.

I have just covered a distance of some 8,000 miles on a 5 h.p. Stanger spring frame model, and have not yet come across a machine that possesses the comfort of a Rolls-Royce that one has in a Stanger machine.

The running of the engine at all speeds is really wonderful, with excellent acceleration and truly marvellous climbing power; more so, that one cannot overheat the engine.

Apart from this wonderful engine, one has a rigid frame motor cycle with what appears to me to be car springing entirely, the rear wheel only being sprung, not the frame.

I, myself, drive a 1921 23 h.p. Renault limousine, and can honestly say that there is very little to choose in smoothness of running and springing.

M. BARRETT.

Sir,—Relative to the question as to which is the best all-round solo motor cycle, I am surprised that the 4 h.p. flat twin Harley-Davidson has so far not received the attention it deserves.

I have owned well over thirty machines, amongst which were included the Raleigh, Douglas, Lea-Francis, Sunbeam, Triumph, Zenith, Scott, 7 h.p. F.N., A.J.S., B.S.A., Enfield, Humber, James, etc., but I have yet to discover a machine equal to the fascinating mount above mentioned. Except for inaccessibility it scores on the following points: Revolutions, flexibility, even torque, balance, reasonable speed, magnificent steering, comfort, 3in. tyres, a no-trouble enclosed transmission, three-speed gear box and engine mechanically lubricated, low riding position, twist grip controls, spare petrol compartment in tank, etc. I would, however, prefer the kick-starter on the right side of the machine, and the valve tappets better protected from the summer dust.

I rule out all single-cylinder and V twins on account of their uneven torque, the consequent vibration of them tiring the rider on a long ride even more than do the bumps of the road. The A.B.C. would doubtless find a soft spot in my heart if it were designed for 3in. tyres, as greasy tramlines are a serious menace to the soloist at night riding smaller tyres. I liked the Raleigh for some things, but the steering left much to be desired; also the lubrication system must take second place where the Harley is concerned. But I would that my pet incorporated the magnificent finish and the hand clutch of the Raleigh! Then it would be indeed "some" bus.

Hendon.

Sir,—Whatever may be the outcome of the present interesting discussion in *The Motor Cycle*, may I claim for the Beardmore-Precision the title of the second best machine in the world, by the consensus of opinion amongst the manufacturers themselves? For if you were to ask any maker which is the best machine, he would naturally say his own; but on being asked to name the second best he must say, in point of design coupled with all-round excellence, the spring-frame Beardmore-Precision.

Passing over the many excellent features of the engine (such as detachable cylinder head, automatic lubrication, and foolproof gear), look at the frame. The use of pressed steel is a thing which has been suggested in *The Motor Cycle* for many years. In the Beardmore it is in use to the fullest possible extent. Then it is almost acknowledged that ultimately

we must have spring frames; and, in my opinion, the only design that can stand the test of time is the Beardmore, if only because of its simplicity, there being only one group of springs to each wheel.

I shall be satisfied for the present if you allow me my title for my favourite make.

NULLI SECUNDUS.

Penicuik.

Sir,—For each individual owner to state off hand that *his* motor cycle is the best is rather an arbitrary way of settling the matter. Personally, I have owned a Norton, Douglas, 1920 Sunbeam, and presently shall have a 1921 sporting Sunbeam. For me to settle which of the machines I have mentioned as being the best motor cycle would be an arbitrary act on my part. The above machines are only four of the products of the motor cycle world. Once I have ridden every solo machine manufactured I will then consider myself in a position to say which is the best.

A.B.C.

Wishaw.

Sir,—Mr. E. S. Badcoe's letter moves me to ask for a little of your space. He says, "It is sheer waste of time and space for a correspondent to state that he considers his 2½ h.p. Tink-a-punk to be the world's best-sold machine." Do not let us forget the word *solo*. Surely if the Tink-a-punk will do all that can be reasonably asked of a solo machine, it has just as much claim to be considered as the 3½ h.p. Hogbus or the 7-9 h.p. Incinerator.

What are the requirements of a solo machine if it is to justify a claim to be the world's best? It must be reliable, capable of sustaining a good average speed, able to climb anything, economical in petrol, oil, and tyres; comfortable, easily controlled at all speeds on all surfaces, and of first-class materials and finish throughout. If a machine is capable of fulfilling these conditions, and will keep its tune a reasonable length of time, then I say that it is emphatically *not* a "waste of time and space" to consider its claims.

Now can the small machine fulfil these conditions? I can answer for one that does. Its cubical capacity is 220 c.c.; it is unfailingly reliable; it will *average* more than 30 m.p.h. all day; it will climb anything climbable (standard machines have climbed Applecross, the Screw Road, Alt-y-Bady, Park Rash—a sufficiently representative selection surely); ordinary petrol consumption, about 130 m.p.g.; and oil, 3,000 m.p.g. Tyres. I cannot give definite figures, but very light on them. Comfortable. I have ridden 325 miles between sunrise and sunset on one, when my biggest previous day for nearly a year was eighty-four miles. Control at speed and in grease, sand, stones, rocks, and grass, excellent. Materials and finish both unexceptionable.

As a solo touring machine, it at least cannot be "waste of time and space" considering its claims, which I hope Mr. Badcoe will now admit, as he obviously knew nothing previously of the capabilities of the standard three-speed Velocette.

Usual disclaimer.

(REV.) J. M. PHILPOTT.

[Many of the letters which we continue to receive on this subject cover the same ground as others that have been already published, or in some cases where fresh names are mentioned, the arguments may well be summarised. For example, "16 H" (Notts.) reiterates the claims of the Norton with close gear ratios, Binks carburetter, and Ricardo piston, on the grounds of reliability, comfort, economy, finish, easy starting, speed, flexibility, and hill-climbing. The same machine is chosen by "EL 6196"

(Winchester), who, incidentally, calls attention to its accessibility compared with American designs. In the course of a very reasonable letter, Mr. A. Horneck admits his inability to state a definite opinion, but chooses the W.D. model 2½ h.p. Douglas from among the machines he has tried. Two further Scott enthusiasts, Mr. H. R. Hardcastle and "Enthusiast" (South Mimms), repeat at length the claims of the twin two-stroke for recognition. In the case of two satisfied Sunbeam owners, Flight-Lt. A. D. Pryor and Mr. W. H. Fortington, their arguments are based on mileage figures and low running costs, as well as such qualities as absence of vibration and mechanical silence. Mr. H. de Main Clark replies to the critics of his choice of a Rudge, pointing out that, although he owns a Sunbeam himself, a friend on a Rudge-Multi leaves him well behind on hills which necessitate a change down on a three-speed gear machine. He also emphasises that the price of the Rudge includes a clutch. "Duzit" tabulates his reasons for considering that the 3½ h.p. o.h.v. Duzmo takes first place among solo mounts, and particularly sporting solo mounts. His chief points are safe steering at high speeds, very fine acceleration, and the standardisation of 26×3in. tyres and mechanical lubrication. Another Ariel rider, Mr. J. O. Crawford, is emphatic regarding the merits of the 3½ h.p. model as a solo machine. He instances all-round durability and reliability, power, speed, fuel economy, and controllability (helped by a dual hand and foot clutch control and a very sensitive throttle). Reliability, fair speed capabilities, comfort, finish and design, and price are "Jeghde's" summarised list of the qualities which, in his opinion, entitle the Beardmore-Precision to first consideration.—Ed.]

LUBRICATION OF TWO-STROKE ENGINES.

Sir,—Mr. V. C. Rayner in his article on the above subject, resurrects the idea of controlling lubricant supply by means of interconnected throttle and oil control, asserting that systems of lubrication depending upon engine speed obviously fail, because they supply a possible excess at high engine speeds.

Would not the interconnected throttle and oil idea fail, by reason of either (a) having to supply a regular excess, or (b) a periodical serious shortage when most needed? Suppose a machine in hilly country—a gradient is met which calls for full throttle on top gear, and eventually demands a drop to bottom (most two-strokes have only two speeds), the throttle being, of course, simultaneously shut off to about one-third open, say, engine speed being very much increased, and cooling draught reduced considerably, both of which latter factors call for more oil, whereas the throttle opening allows but a meagre supply!

Lubrication, like most details of motor cycle construction, being a compromise, let us have the best compromise, which, in lubrication, must entail a slight excess at some time, to ensure a liberal supply when urgently needed. Load demands quality; consumption should govern supply. J.W. Derby.

Sir,—In his very interesting article, Mr. V. C. Rayner raises a point which for some time I have been greatly interested in, i.e., roller bearings v. plain bearings.

From experiments, I find that the plain bearing has a longer life than the roller bearing, and that the wear in the latter will increase in greater proportion than that of the

former. I will endeavour to point out my reasons (which are probably well known to many):

The crank pin is running at the same number of revolutions per minute as the big end of the connecting rod, but the actual race in the rod being of larger diameter than that of the pin has greater surface speed.

From this, it is obvious that the rollers will be sliding on one surface or the other, however perfectly the bearing may be functioning.

I have personally fitted phosphor-bronze bearings to several machines of a prominent American make, and find them a great success as regards general wear, easy starting, slow tick-over, and acceleration.

On the other hand, there is a slight decrease in maximum speed; but that, as it is, is quite fast enough for anyone on the road.

My experiments have been essentially on big twins; but I think the same will apply to smaller engines, including two-strokes. N. A. BLOOMER.

"A CATECHISM FOR POTENTIAL CYCLE CARISTS."

Sir,—I was very pleased to read the interesting letter of "Three-wheeler" in *The Motor Cycle* of October 27th.

Our family consists of father, mother, son (12), and daughter (10). I have had several sidecars, and while on holiday last year on a 6 h.p. outfit, with four up, plus luggage, etc., we averaged 130 miles a day for the first four days, covering some of the ground mapped out for a previous trial in Wales, and during a fortnight covered over 1,000 miles.

This year we wished to get to Scotland. The questions of comfort and engine power (with the children a year older, and other little points only known to the family man) were considered. The result was that the proposed trip did not come off. The kiddies spent their holidays at different times and places from their parents.

However, the parents went for a tour, which included practically a week's stay at Coventry, and during that time the evergreen and burning question was, What can we find in the way of a small car suitable for our requirements and at a reasonable price? The answer, unfortunately, was "nothing."

Should a purchaser go in for a Rover, Coventry Premier, or other similar machine, he will find that each machine is only comfortable for two, although an improvised "dickey" could be made out of the tool-box. The nearest approach to a first-grade sidecar outfit would appear to be a two-seater Swift; but then the price was prohibitive.

The result is that I have not emulated "Three-wheeler," and he has my sympathy. I shall purchase a two-seater Matchless sidecar. Why?

1. Because there are only three wheels instead of four, consequently one tyre less.
2. Tax only £4, instead of £9 or £10.
3. The reserve of power is greater than in an 8 h.p. car.
4. Four up can travel in comfort.
5. About half charges are made for repairs, garage, insurance, accessories, etc., as compared with a car.

The carist will say that he can motor to tennis or go out to dinner without dressing up like a diver of the Stone Age; but, being out in all weathers, and having evening functions to attend, sometimes in evening dress, I have never yet caught cold, and have always arrived clean. At present, therefore, I remain as I am, a sidecarist and

Woking.

FAMILY NAN.

PASSENGER MACHINES.—First Show Number of THE MOTOR CYCLE

NEXT THURSDAY'S issue of "THE MOTOR CYCLE," dated NOVEMBER 17th, will be devoted chiefly to Passenger Machines.

Of great interest to all motor cyclists, and to sidecar owners particularly, next week's enlarged issue—the first of the three Olympia Show Numbers—will contain much informative matter relating to all types of sidecar-machines. Many special articles are in course of preparation, including:

ECONOMICAL MOTORING FOR TWO, not to mention the possibilities of transporting whole families at a cost less than railway fare for one.

THE MODERN RUNABOUT.

COMFORT AND CONVENIENCE for passenger and driver.

NEXT YEAR'S SIDECAR OUTFITS. 1922 SIDECAR ATTACHMENTS. Etc., etc.

NEXT THURSDAY.

4d.

HEAD LAMP DIMMING ETIQUETTE.

Sir,—It is not possible for the average motor cyclist to dim his lamp, but when approaching a car which has lowered its lights for his benefit, it is quite simple for him to put his hand over the right-hand side of the lamp, thereby eliminating the glare from the driver of the car. It also shows the intention is good.

Buxton.

MANNERS, PLEASE.

Sir,—My experience may be helpful to those who use head lamps that can be tilted, as with the Lucas, etc. When approaching a car with powerful lights I tried, as an experiment, the tilting downwards of my lamp, throwing the light on to the front wheel. Invariably, the approaching car has switched off while passing.

This leads me to believe that drivers leave head lights on from forgetfulness, rather than from want of courtesy, and the tilting down of my lamp is a reminder to which they respond.

Durham.

MOONSHINE.

BRITISH MACHINES IN SWITZERLAND

Sir,—As a reader of your valuable weekly, I was greatly interested in the recent letter on British machines in Switzerland.

My friend and myself are just back from a tour through France and Switzerland. This is our fourth tour in Switzerland on motor cycles, on different makes each time, and must confess that the most enjoyable has been this last season on our 4 h.p. Triumphs. We covered exactly 2,500 miles without the slightest engine trouble. Our trip included the famous Swiss Six Days Trial. Of all the machines we have ridden here and abroad, we must say that the Triumphs are the most reliable.

FULLY EQUIPPED FOR A TOUR
IN THE ALPS.

A reader's heavily-laden Triumph, snapped in a picturesque spot during a recent holiday in Switzerland. (See accompanying letter.)

ERNEST OGGIN.
MICHEL GENOUD.

EXPERIENCES WITH A SIDECAR SUBSTITUTE.

Sir,—I was glad to see the appreciation of the Scott Sociable in your correspondence columns recently.

As I took delivery of No. 1 last Easter, I may perhaps be allowed to give the experience of the first private owner.

Right at the start I had transmission trouble, perhaps due to my own clumsy handling; anyhow, heavier transmission was fitted, and since then I have had no involuntary stops, save for tyres and a choked petrol pipe, and my mileage approached 5,000. Petrol consumption (including oil), 70 m.p.g. at least, and the studs are still showing on the tyres.

The machine is as fast or faster than anything in its class, and will climb anywhere where the wheels will grip. The bevel is certainly on the noisy side; not, I think, due to the bevel itself, but to the Scott disc wheel, a beautifully light and strong structure which has the defects of its qualities and rings like a cut glass tumbler.

This trouble has apparently been successfully tackled, as recently I saw a later model, and the bevel was absolutely silent.

I think Mr. Scott made a great mistake is not entering a team for the Six Days. Technically, the "Crab" may be a sidecar: practically, I should be willing to go to the other

extreme and enter it in competition with the most expensive four-cylinder light cars, as I maintain the machine does everything the light cars can do at half their initial outlay and upkeep, and would beat them on many points; certainly for comfort at speed on rough roads.

The Scott Sociable is delightfully light and easy to start, steer, and handle; gear changing is not a nicely calculated operation calling for double clutching, as on most cars. Tinkering is unnecessary. Preparation for a strenuous week-end consists of a turn to four grease cups and filling the fuel tank.

Up to now I am more than pleased with the machine; and I consider it to be one with a great future.

ERNEST CREIGHTON.

SIDECAR CONNECTIONS.

Sir,—Apparently, "Wharfedale's" remedy for an obvious fault is to try to transfer the danger elsewhere! That, in effect, is all that would happen, if one connection was made flexible, as suggested.

I am quite aware of the fact that relative movement (whip) of chassis members is always apparent on bad roads, and it is because I think that the stress of that whip should be equally distributed between all the connections that I differ from "Wharfedale" in his advocacy of one flexible connection. It is beyond my fallible comprehension to see why turning the rear fork connection in the manner suggested will help matters at all. The only apparent effect would be to make the connection itself more vulnerable!

I contend that rear fork fractures are due to several causes, one of which is the jar caused by the back wheel dropping into a pot-hole. Actual experience of unsprung pillion riding will amply demonstrate this point on a pot-hole road. The rear wheel, being most heavily loaded, causes most shock on bad roads, which is entirely transmitted to the back forks and connections. In such circumstances, what would happen to "Wharfedale's" flexible connection? Surely the obvious weakness is in the eye and bolt (both being further weakened by wear), which, being flexible, i.e., not supported by the jaws of the yoke, take the shock entirely, causing fracture sooner or later.

The object of sidecar chassis designers should be to provide a perfectly rigid chassis, together with suitable attachment arms and fittings, which would ensure (a) no risk of mal-alignment or maladjustment, (b) that whip would be reduced to the absolute minimum—the Scott design, as before mentioned (and, despite "Wharfedale's" pitiful attempt to claim its allegiance!), being an excellent example. And where does one find more engineering ability than at the Scott works? With the type of design specified, every road shock, from either of the three wheels, will be, practically, equally distributed between all the connections, thereby eliminating existing non-distribution of stresses. Spring the sidecar wheel by all means, with due provision for permanent lateral rigidity, but there can be no compromise on the question of connections; either all or none must be flexible.

I must leave readers to judge which is more Gilbertian, "Wharfedale's" idea of flexibility, i.e., by means of sloppily fitting rear connections (in original article), or my suggestion so to alter motor cycle design as to enable them to stand up to sidecar work—which only needs stronger section tubing with a ribbed liner!

J. WILLEY.

TYRES, NEW, EXPERIENCES WITH!

Sir,—I recently purchased a 650×65 mm. extra heavy cover of a famous make at full list price. At about two hundred miles this tyre developed an ominous bulge on the side. I at once removed it, and found the fabric split in the exact line of the wearing of the canvas and the joint in the cover. The rubber outside was untouched, except a tiny nick where it had fouled some part of the machine owing to the bulge.

I returned the cover to the makers for their opinion. After a lot of irrelevant correspondence about the beads and rims and the cover blowing off the rims, which it never did, they decide that "this cover has been damaged by a cut received in the course of ordinary fair wear." They offer to repair it at their usual rates!

This sort of thing is going to make the cost of motor cycling prohibitive, and one can only think that the tyres supplied to competition riders are a different product altogether from those supplied to the public.

S. R. DRUITT.

EXPLAINING THE SPARK GAP.

Sir,—May one be permitted to chip in to the spark gap controversy?

Mr. Barclay sets out the pros and cons in a very lucid manner, and I agree with him that a spark gap, properly installed, may have certain advantages.

It has, however, certain marked disadvantages, and one which your correspondents seem to have left out of consideration is the fact that although an additional spark gap causes the voltage to build up to a high point before discharging, when the discharge does take place the energy is not all available at the sparking plug's points, some of it being dissipated at the points of the auxiliary gap.

The sum total is that an auxiliary spark gap enables one to carry on to some extent with a scrap plug, or defective lubrication. On a well designed motor cycle, fitted with a suitable plug, it has no advantages whatever.

Mr. Hartley, in his first letter, mentions that the makers of one of these gadgets claimed in an advertisement in the daily papers that the device collected frictional electricity from the engine. This claim, of course, is adjectival nonsense. I have no doubt the device would be successful in collecting quite a large quantity of "hot air."

In Mr. Hartley's second letter he seems to have run off the line a bit because he reminds "Radio" "that the rate of flow of electric current is constant where the capacity is the same." This is not so, and I would suggest that "Radio" forgets it again. (By the way, since current is the rate of flow, what is the rate of flow of current?)

Also, his statement about two gaps in series is not quite in accordance with facts. The truth about gaps in series is very much as stated by Mr. Freeman Lee in his letter of the same date.

I agree with Mr. Hartley's last two paragraphs, and if he will take the trouble to look through the advertisement pages of almost any paper I think he will agree with me that there are still a large number of "flats" in existence, and an equally large number of persons selling—shall we say—"flat traps."

MATT. JENNISON.

Sir,—Having read with interest the letters of your correspondents re the merits of an extra gap in the circuit of an ignition system, I have been wondering whether anybody has thought of the following explanation as to why an extra gap improves the spark.

You are no doubt aware that in explaining the behaviour of the "somewhat" bigger sparks which occur in thunderstorms two terms are used, namely, "Steady Strain" and "Impulsive Rush."

Although, perhaps comparison between a lightning discharge and the spark discharge in an ignition circuit may not be easy (irrespective of on a basis of dimension), I consider the explanation of lightning phenomena will go a long way to explain why an extra gap can be made beneficial to the plug gap. In experiments conducted by (I believe) Sir Oliver Lodge, he made use of apparatus represented by the enclosed diagrams. In fig. 1 *a* represents a church steeple, pointed; while *b* could be some flat topped building. Both *a* and *b* are electrically connected to the ground *g*. A piece of tinfoil *c* represents a cloud. On subjecting *g* and *c* to a steadily increasing potential difference, a spark always occurred between *c* and *a*, but not between *c* and *b*. Now turn to fig. 2. *c* was now electrically isolated, and an electrode *e*, representing another cloud, was introduced near *c*. *e* and *g* were now subjected to a steadily increasing potential difference. The result was to create a "steady strain" between the cloud *c* and the two ground objects *a* and *b*, up to a point when a spark occurred between *c* and *a*. The strain between *c* and *g* was now suddenly increased, and it was found that the resulting spark, in the form of an "impulsive rush," was as likely to strike *b* as *a*, although *b* was further away. And the experiment showed that where an impulsive rush existed the spark was both more uncertain and more damaging—more uncertain in

that it did not behave in accordance with the usual rules of discharge surfaces and distances; damaging, in that what spark did occur occurred in the shortest possible time, thereby being hotter and more concentrated.

The case of the magneto discharge is very similar except that only two gaps altogether need be considered. In fig. 3 *a* is that part of the magneto secondary circuit that lies between the external gap *ab* and the internal gap *ac*. At or after the moment when the interruption of the primary takes place the high-tension secondary is being built up, and a steady electrical strain is created between *c* and *a* in the same manner as between *c* and *g* in figs. 1 and 2. If now the gap *ab* is smaller than *ac*, a spark occurs more readily at *ab*, *a* is suddenly electrically overcharged, and the resultant "impulsive rush" at *ac*, the internal gap, creates a hot, destructive spark—destructive, that is, to anything that may lie in its path. If, on the other hand, the gap *ab* be greater than the gap *ac*, as in fig. 4, a different state of affairs exists. In this case, when a spark occurs at *ab*, apart altogether from the large amount of energy which is dissipated at that point, due to the larger gap, and is, consequently, wasted to igniting the mixture, this spark takes place just too late to be of any value, because *ac*, being a smaller gap, discharges, almost simultaneously, any impulsive rush which exists in this case, serving to keep the spark burning at gap *ac* for a longer period than would otherwise be the case. In other words, the energy dissipated at *ac* is, in the latter case, not sufficiently concentrated. It must be borne in mind when considering this subject that it is the amount of energy discharged at the fraction of a second when the spark begins, rather than what subsequently follows, that matters. If you can concentrate most of the energy of the spark into actually breaking down insulation it does not matter what the character of the spark is once the insulation has been energetically overcome. "Impulsive rush" does this to a marked degree in the case of the magneto if the external gap be smaller than the internal gap, although the result may be too uncertain to be of any practical value to the motorist.

W. H. MASSY.

SUMMARY OF CORRESPONDENCE.

On a recent tour from London to Eastbourne on a 4 h.p. standard Triumph sidecar, covering a distance of 320 miles (two up), "Ignoramus" averaged 92 m.p.g. He wishes to know if other Triumph owners can equal this.

Referring to the discussion on head lamp dimming, "OH 4634" points out that Messrs. Brown Bros. have, since 1911, marketed the Autoclipse lamp, which possesses a simple dimming device consisting of a dull metal disc, which may be lowered between the reflector and the flame.

Regarding the controversy about the Brough Superior engine, Mr. G. F. Randall opines that in general layout it is the same as the engine used by C. R. Collier in his match with Jake de Rosier on July 15th, 1911.

Books & Maps for Motor Cyclists.

Issued in conjunction with *The Motor Cycle*.

"MOTOR CYCLES AND HOW TO MANAGE THEM."

The standard handbook on the motor cycle.

Price net, 2/6. By post, 2/10.

"HINTS AND TIPS FOR MOTOR CYCLISTS."

New Edition. Just Published. Price net, 2/- By post, 2/3.

"TRACING MOTOR CYCLE TROUBLES."

A system for tracing motor cycle faults and of remedying them when found. Fourth Edition.

Price net, 2/- By post, 2/3.

"TWO-STROKE MOTOR CYCLES."

A reliable treatise on Two-strokes, from the rider's point of view.

Price net, 3/- By post, 3/3.

"MOTOR CYCLE REMINISCENCES."

By "IRON," of *The Motor Cycle*.

Price net, 5/- By post, 5/3.

London. Set of three, complete in case. Price net, 5/6.

Book post, 5/10. Set of Two Maps—England and

Wales, London. Price net, 4/6. By post, 4/8.

"THE MOTOR CYCLE" ROUTE BOOK.

With 32 pages of Road Maps. Price net, 5/- By post, 5/4.

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C. 4, and whether intended for publication or not must be accompanied by a 2d. stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES.—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 2d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

TAPPET CLEARANCES.

Q. To get good results, how many thousandths of an inch clearance should there be in the tappets of my 4 h.p. 1921, Triumph? Kindly advise for inlet and exhaust.—E.M.R.

The clearance in the tappet of the 4 h.p. Triumph should be approximately ten thousandths exhaust and six to eight inlet.

SIDECAR FOR A LIGHTWEIGHT

Q. Could you give me the name and address of the makers of a really light sporting sidecar which could be readily fixed to a 2½ h.p. Douglas? Would the frame of the machine have to be altered in any way? What gear ratios would be most suitable for a moderately flat district, both my passenger and myself being lightweights?—D.H.M.

You would find any of the well-known lightweight sidecars suitable for your machine. We do not usually recommend sidecars for use with purely solo machines, but if you decide to fit a sidecar to your 2½ h.p. Douglas we would recommend you to fit the smallest front sprocket obtainable from the manufacturers, since the gear ratio should be kept very low for sidecar work.

WEIGHT DISPOSITION OF SIDECAR BODY

Q. Having read with much interest "Wharfedale's" recent article on "Sidecar Attachments," I would like your opinion as to the correct position of the sidecar body on the chassis. I notice that quite a majority of sidecars on the road have the body slung very forward, throwing the weight of the car and passenger on to the front connections and front frame of the cycle, with a tendency to twist the latter from back to front. Only recently I put the body of my sidecar back, so that the weight when loaded was more or less balanced over the axle, and was surprised to learn how much easier the whole machine ran; it was also easier to steer. Which do you consider the correct position for the sidecar body?—F.K.T.

Undoubtedly the best distribution of weight in a sidecar is that which balances most of the weight over the back axle. An example to which sidecars may be approximated is the horse-drawn dog cart, so laden that the shafts merely float in the harness of the horse—this ideal, of course, is difficult to obtain in a sidecar.

LOST POWER AFTER OVERHAUL.

Q. My 2½ h.p. T.D.C. has lost power and speed since an overhaul. I have had the brass main bearings turned up, as the rollers were subject to air leaks; also new piston rings. There are no air leaks, the spark is good, jet No. 26, compression better than before, also crank case suction. Timing points just breaking, piston 2 mm. from top dead centre, and fully retarded, yet the engine overheats. I have had it carefully run in, and it is now quite free. There is the same thickness of packing between the cylinder and the crank case as before, also the piston is on correctly. The exhaust is not blocked. The only difference is that I am running on one-third benzole and two-thirds petrol instead of all petrol, and still the engine refuses to take full air, and will not start from cold without having the air intake stopped up. I am using the same sparking plug, and the wheels are free.—S.L.

It is possible that your engine requires still further running in, and we should recommend you to advance the ignition point until the contacts break with the control fully retarded when the piston is on top dead centre.

THE WORCESTER CLUB'S PRESIDENT'S CUP TRIAL.

J. A. Newman (3½ Douglas) whistling cheerily on his way up Trefadoc. He was one of the winning team (Worcester Club).

SILENCING A SINGLE.

Q. Several Triumph riders and myself would be glad to know of any method of completely silencing the exhaust of a Triumph, as the standard fitting is rather noisy.—B.H.B.

The only method of silencing the exhaust on a single-cylinder motor cycle is to fit an extra large silencer. In your case you might be able to fit a long exhaust pipe to your machine in place of the present pipe and silencer, and fit a large expansion box at the end similar to that used on the Zenith machines.

LIGHTING-UP TABLES.

Q. Does your lighting-up time-table, as shown in *The Motor Cycle* each week, apply to Ayrshire, Scotland, as well as London? Is the lighting up time the same in both places?—E.M.R.

The times given in our lighting-up table are for London. For Ayrshire you may add roughly eighteen minutes to the time, plus about three minutes in March, six minutes in April, ten minutes in May, June, and July, six minutes in August, three minutes in September, six minutes in October, twelve minutes in November, fifteen minutes in December and January, and nine minutes in February. These figures are only approximate, and you would be well advised to get the local correction for latitude and longitude.

ADJUSTING WEIGHT OF NEW PISTON.

Q. Having recently had my 3½ h.p. single-cylinder engine rebored and a new piston fitted, with resulting increase in power, I find that the engine vibrates badly, the rivets securing the throw pin to the flywheel shaking loose in less than 100 miles. On searching for the cause, I find that the new piston is two ounces heavier than the old one, which no doubt causes the vibration. Will you be good enough to inform me what additional weight should be added to the flywheels to compensate for the extra two ounces in the piston?—W.S.M.

Your best plan would be to endeavour to lighten the piston to the necessary amount, which will probably be a comparatively simple job; whereas to rebalance the engine would cause some difficulty, and you would have to add weight to the balance weights, and there is usually very little room to do this in an internal flywheel engine.

BROKEN SPOKES.

? An 8 h.p. sidecar outfit that is being used over very rough roads and with very heavy loads is continually breaking the spokes. I have had the rear wheel rebuilt with No. 9 spokes, but with very little better results. Can you give me the address of any wheel builders who would be able to construct a wheel either of the artillery pattern or with a solid disc in place of spokes?—G.M.N.

We do not know of anyone who will construct a wheel such as you require, as so far solid discs or artillery pattern wheels have not proved satisfactory on motor cycles. It certainly should not be necessary to have a wheel built with any heavier spokes than 9 gauge, and we can only think that the breakages result from faulty methods of driving or careless use of the clutch.

READERS' REPLIES.

28×3in. TYRES ON 26×2½in. RIMS.

We notice in your "Questions and Replies" page of *The Motor Cycle* of the 27th ult., in reply to a correspondent, you say:

"It is quite satisfactory to fit such a tyre" (28×3in. on a 26×2½in. rim), and that several members of your staff have followed the practice, with every satisfaction.

That may be so, but there is, all the time, an element of risk both to tyre and rider; and, knowing you desire to be scrupulously accurate in these matters, a few facts and figures herewith appended may be of interest to your readers who may be tempted to do likewise.

The 26×2½in. (D2) rim has a circumference of 71½in. The 28×3in. rim has a circumference of 73in. Difference, 1½in.

The 26×2½in. (D2) has a section measurement of 1½in. The 28×3in. has a section measurement of 1½in. Difference, ¼in.

The sketch shows the 26×2½in. section and the 28×3in. section rims, showing comparative depths under clinch. The 26×2½in. (D2) rim, being much smaller in circumference, the 28×3in. tyre must be a very loose fit upon it, making it liable to creep and cut the bead. The 26×2½in. (D2) rim being much narrower, there is not proper room for the extended

flaps of a 28×3in. cover, making it difficult to get the cover on the rim. The space under the clinch of the 26×2½in. (D2) rim is much less than the 28×3in.; consequently the larger bead of the latter tyre cannot go under the clinch of the 26×2½in. (D2) rim, with the result that the bead never reaches its proper anchorage. From the above, it will be seen that there is an appreciable difference in sizes and fittings, and that there is sufficient reason why the Palmer Tyre, Ltd., does not recommend the fitting of a particular size tyre to a different size rim.—THE PALMER TYRE, LTD. (H. W. Weald).

[While agreeing with our correspondent's remarks about the appreciable differences in circumference and section of the two rims, the fact remains that

there are to-day hundreds of 2"×3in. covers giving very satisfactory service on 26×2½in. rims, and we have yet to find a case where excessive wear at the bead or rolling could be directly traced to this cause. We have several times experienced sudden punctures with these "oversize" covers, with no ill effects whatsoever; and on one occasion we rode fully five miles with an uninflated 28in. cover on a 26in. rear wheel. Until larger tyres are standardised, we consider that the fitting of these "unofficial" oversize covers is to be recommended as a very excellent compromise.—Ed.]

CARBURETTOR ADJUSTMENT.

Reference to "F.S." enquiry (October 20th) on the Binks carburettor for 2½ h.p. Douglas, may I suggest that a leakage of petrol is taking place at the base of one or more of the jets, allowing petrol from the float chamber to enter the gas mixer without travelling through the jets? As "F.S." is only getting the ridiculous mileage of forty to the gallon, I would further suggest he temporarily stop up the jets with wax, and then endeavour to start the engine. I find the correct jets for a 2½ h.p. Douglas are 000, 0, and 6.—A. C. ROBBINS.

EXPERIENCES WANTED.

Readers' replies to questions published under this heading should be sent to the Editor, "The Motor Cycle," Hertford Street, Coventry, when they will be forwarded direct to the querists concerned.

"J.S.T." (Suckley).—Low acetylene lighting set.

"H.N." (Manchester).—2½ h.p. Royal Ruby, sports model: Speed, climbing, and general running.

"H.E.W." (London, S.W.11).—5-6 h.p. Raleigh, solo and sidecar: Speed, acceleration, performance; ease of handling solo.

"G.G.G." (Glasgow).—2½ h.p. Barr and Stroud engine, solo: general performances, reliability; if suitable for heavy frame and 2½in. tyres.

"W.S." (Perth).—7 h.p. F.N., with sidecar: Consumption, oil and petrol overheating, power and power maintenance, wear, breakages, transmission. How compared with Morgan Runabout?

"A.B." (Maidstone).—G.N. cycle car after 8,000 miles running; especially chain adjustments, springs, broken parts, and wheel bearings. Also possibility of better silencing.

Important Dates.

Fri., Nov. 4th, to Sat., Nov. 12th—
Automobile Exhibition, Olympia and
White City. (See "The Autocar.")

Mon., Nov. 28th, to Sat., Dec. 3rd—
The Olympia Motor Cycle Show.

Sat., Dec. 3rd to Tues., Dec. 13th—
Brussels Show.

Mon., Dec. 26th, Tues., Dec. 27th—
M.C.C. London-Exeter London Trial.

Sat., Dec. 31st.—N.W. London M.C.C.
Twelve Hours Open Winter Trial.

Fri., Jan. 27th, to Sat., Feb. 4th, 1922—
Scottish Car and Motor Cycle Show.

A Change of Address.

X.L. Motors, Ltd., the makers of the X.L. machines recently reviewed in our pages, have now moved into new premises at 506, Ulster Chambers, 168, Regent Street, London, W.1.

A South London Works Trial.

On October 22nd, the employees of A. E. Parnacott's works held a successful half-day trial. Starting from Penge, the route included Whyteleaf, Succombs Hill, Sunningdale Hill, and Cudham Church Hill. W. R. Dickens (4 Douglas) and E. C. Anderson (2½ Ivy) made outstanding performances on the hills.

Plugs for all Engines.

The makers of Lodge sparking plugs (Lodge Plugs, Ltd., Rugby), having recently published lists of their products suitable for almost all types of engines, still find that users occasionally select the wrong type of plug for a particular engine; in all cases of doubt they offer advice on receipt of particulars regarding make and date of the engine in use.

71½ m.p.h. for 200 Miles.

The G.N. which won the 200 mile cycle car race at Brooklands was equipped with one of the new square-shaped 90° M-L magnetos having the special steel magnets recently described in our pages.

In Denmark.

A reliability trial organised by the Copenhagen M.C. recently incorporated a novel feature. The riders had to ride in pairs, each pair having to start and finish together. First prize was secured by two Wolf riders, who covered 880 kilometres (550 miles) in twenty-four hours without loss of marks. Dunlop tyres were used on both machines.

A Permanent Lighting-up Table.

An ivoryine lighting-up table, suitable for fitting to the dashboards of sidecars or cycle cars, has been prepared by H. Taylor and Co., Ltd., 52, Sussex Place, South Kensington, London, S.W. It is being offered free to readers of *The Motor Cycle*.

Auto-wheel Parts.

The prices of spare parts for Auto-wheels have been reduced by 10%, and Auto-Wheels, Ltd., Russell Road, Kensington, London, W.14, carry a large stock, and can deliver immediately. Orders for spares, however, should include the number of the engine for which the parts are required.

Catalogues Received.

British Lighting and Ignition Co., Ltd., Adderley Park, Birmingham: List of the B.L.I.C. magnetos, several of which are suitable for motor cycle engines.

Advance Details of 1922 Models.

Two New Long Stroke Sunbeams.

A Big Single for Sidecar Work and a Special T.T. Machine added to Sunbeam Range, which now includes Five Distinct Models.

ONE year's T.T. model very often becomes a next year's sports model, but Messrs. John Marston, Ltd., have gone one better, and now offer to the public their 1922 T.T. motor cycle, which has an entirely new long stroke engine and a long wheelbase frame. This machine embodies all the lessons of past racing experience, and has been on the road for a considerable period in the hands of T. C. de la Hay and George Dance, who inform us that without the special tuning which every Tourist Trophy mount receives, it is several miles an hour faster than the machine which won the 1920 Senior T.T. and this year's French Grand Prix. That is the Sunbeam offering to speedmen for 1922.

There is, however, a large coterie of Sunbeam enthusiasts who drive sidecars, and who, up to the present, have had the choice of the $3\frac{1}{2}$ h.p. outfit and the 8 h.p. J.A.P.-engined twin. A long-stroke 590 c.c. machine has now been introduced, which is a worthy addition to the big single sidecar outfits on the market.

The Full Programme.

Every class of rider, save those who favour lightweights, is catered for in the 1922 Sunbeam range of five machines. These are briefly outlined below:

$3\frac{1}{2}$ h.p. T.T. model: new engine, longer wheelbase, no carrier or kick-starter. Price £136 10s.

$3\frac{1}{2}$ h.p. "Sports" model: as popular 1921 prototype, but with kick-starter. £136 10s.

$3\frac{1}{2}$ h.p. "Standard" dual-purpose mount: similar to the current year's model, but with "belt rim" brakes, Druid type forks, and without interchangeable wheels. £126.

$4\frac{1}{4}$ h.p. sidecar model: long-stroke engine, interchangeable wheels, Sunbeam leaf spring fork, internal expanding rear brake. £141 15s.

8 h.p. twin sidecar machine, with new type J.A.P. engine. £168.

The T.T. Model Described.

One's first impression of the new T.T. model conjures up the simile of the thoroughbred racehorse, as compared with

A long stroke big single for sidecar work. It has a bore of 85 mm. and a stroke of 105 mm. = 596 c.c.

the more robust hunter, to which the 1920 sports model approximates. There is something of that "slimness" which suggests speed in the slightly lengthened frame. The saddle position is lower, and the handle-bar, instead of being fixed

The detachable split sidecar connection lug, which grips the lower tank rail and the front down tube.

at the head of the steering post, is carried on two brackets extending rearwards and downwards from the head clip. Thus the handle-bar is actually lower than the top of the head tube, which is fitted with a cap. The shape of the bar is particularly graceful, and the average rider will find

on assuming a natural riding position that his hands drop on to the grips.

As before mentioned, the T.T. engine is a new design of the long-stroke type, the bore and stroke being 77 mm. and 105 mm. respectively (489 c.c.), and the compression ratio rather higher than is usually the case. The ports are designed to give an exceptionally big sweep, which brings both the induction and exhaust pipes lower down the cylinder than in the other models.

An aluminium single-ring piston is adopted, and this, in conjunction with the other light reciprocating parts, gives the engine remarkable acceleration. The transmission is by chain through a close ratio Sunbeam gear box without kick-starter; but the little oil bath is only fitted to the primary drive, the rear chain being protected only by a light guard.

As before mentioned, no carrier is fitted, so a place has been found for the tool-bag on the right side chain stay.

Another deviation from the design of the heavier models is that the drip-feed is omitted and a hand pump with two-way tap, which allows oil to be directed to the gear box or engine. The mud-guarding is light, being minus valances, and, altogether, the machine is a true sporting mount. It is capable of lapping Brooklands at 70 m.p.h., and is as flexible, as silent, and as docile as a modest tourist type. This we demonstrated for ourselves one day last week, when we spent an afternoon trying both the new models among the hills around Bridgnorth.

At 25 m.p.h., this T.T. mount, which has a straight through pipe, is quieter than companion machines fitted with the standard Sunbeam silencer.

The Light Solo " $3\frac{1}{2}$."

The sports model of the current year remains practically unaltered, excepting that a kick-starter is now fitted. The gear box is of the close ratio type, and as in the case of all the Sunbeam solo

The standard Sunbeam " $3\frac{1}{2}$ " is now a dual purpose machine, a step between the "Sports" and the $4\frac{1}{4}$ h.p. sidecar models.

Advance Details of 1922 Models.—

mounts, Druid type forks and an aluminium piston are fitted.

"No frills" is the keynote of the standard model, which is intended to meet the requirements of those who desire a dual-purpose mount. It has shoe brakes on both wheels, 650×65 mm. tyres, and, generally, may be regarded as a heavier edition of the light solo model. The wheels are not interchangeable. Druid type forks are fitted, and footboards form part of its specification. Two sidecars are offered as being suitable for this machine—a sporting type and a touring attachment.

New Sidecar "4½"

Although the current 3½ h.p. model as a sidecar machine approximates in performance to the average mount with an engine of 600 c.c., Mr. Greenwood, the Sunbeam designer, has decided that 500 c.c. is scarcely large enough to satisfy the requirements of all who would own a single-cylinder Sunbeam. Some drivers require a fast machine, and are satisfied to travel moderately light, in order not to forfeit the acceleration powers and high maximum speeds of which the 3½ h.p. standard Sunbeams are capable. There are others who have families to provide transport for, or perhaps it is that their wives insist upon hoods, screens, and much luggage.

For this latter class of rider, the new 4½ h.p. Sunbeam has been produced, and from our own experience with the machine we can say that it will fulfil its purpose in every way.

In general appearance, the new model closely resembles the 1920 standard. It has 650×65 mm. tyres, detachable wheels, internal expanding rear brake, leaf spring fork, wide mudguards, and all the appurtenances of the fully equipped sidecar outfit.

A new super Sports Model, with long-stroke engine of 77 × 105 mm. No carrier or kick-starter is fitted.

The cylinder, the dimensions of which are 85×105 mm. (596 c.c.), has a detachable head held down by three studs, but this feature is not intended so much to facilitate decarbonising as to prevent distortion of the cylinder barrel. The piston is of the cast iron type, with two rings. It will be seen that two bore and two stroke sizes are used in the Sunbeam single-cylinder range, 85 mm. bore being used on the 3½ h.p. standard and the 4½ h.p. sidecar engines, the variation of capacity being obtained by the length of the stroke, as under:

	Bore and stroke.	Capacity c.c.
3½ h.p. T.T. engine ...	77×105 ...	489
3½ h.p. sports engine ...	85×89 ...	499
3½ h.p. standard engine ...	85×88 ...	499
4½ h.p. sidecar engine ...	85×105 ...	596

On trying the new sidecar model on the road, we enjoyed a new experience in sidecaring. It was like driving a twin with the beat of a single. The comparatively low compression renders it almost as flexible as a twin, and, fully loaded, one may drive at speeds between 30 and 35 m.p.h. up hill and down dale for miles on end. The maximum speed

is probably in the neighbourhood of 45 m.p.h., although our speedometer needle did not go beyond the 40 m.p.h. mark.

At all speeds the steering is delightfully light, and one may release the handle-bars without any tendency for the wheel to leave the direct track. During our short test, we visited several of the test sections of last Saturday's Midland Centre trial, including a deep watersplash, which all but submerged the engine. But this model is used to such tests, for during the past two years it has participated in many trials, which have helped to bring the machine to that stage of perfection when it shakes off the chrysalis shell of experiment and enters the market a thoroughly proved production.

The 8 h.p. Model.

With the exception that the 8 h.p. twin Sunbeam will be fitted with the latest type of J.A.P. engine (described on page 574), this model practically remains unaltered.

Sidecar Improvements.

Several minor alterations have been made to the Sunbeam sidecar chassis. The current model has three-point attachment at the front by means of straight tubes, one from the footrest bolt and two from the front tube. The 1922 design eliminates the straight tubes, one tube only being used at the front, and this is curved, being attached to the cycle frame by a neat split lug, which grips the lower tank rail and the front down tube. A single bolt is used, but in order that the clip remains in place when the sidecar connection is withdrawn, three small bolts are embodied to retain the lug in position.

At the rear, also, a bent tube is used, connecting with the chassis at a point near the centre of the transverse member, instead of on the longitudinal member as hitherto.

The 1922 Sports model—similar to the 1921 type, but fitted with a kick-starter. The Sunbeam 85 × 88 mm. engine is retained.

A New Royal Ruby Lightweight.

IN addition to the well-known and well-tried spring frame, there are several points incorporated in the design of all the Royal Ruby models which deserve to be called distinctive.

Detail work has always received careful attention, and it has not been found necessary to make changes in the majority of the models. One entirely new type, however, has been introduced for next year—a spring frame 375 c.c. machine.

conservatively rated at 3 h.p. Both engine and gear box—a three-speed with clutch and kick-starter—are of Royal Ruby manufacture, and the machine in the main follows the lines of the smaller-engined model of 1921.

This new model, with the well-known Royal Ruby spring frame, is sold as a solo mount at £90, or with a rigid frame and light sidecar at £105.

The older 2½ h.p. (349 c.c.) rigid

frame sports model is retained, and with sidecar sells at £95, at which figure it appears to be very excellent value.

The main modifications to the luxurious 8 h.p. sidecar outfit have been made in providing even greater comfort for the passenger and detail improvements to the sidecar. The spare wheel is now attached to the chassis instead of to the body; and a new tandem-seated sidecar is an important addition.

Beardmore-Precision Developments.

A $4\frac{1}{4}$ h.p. Four-stroke Single-cylinder. Unit Construction. Pump Lubrication.

THE 350 c.c. two-stroke Beardmore-Precision being now firmly established on the market, Mr. F. E. Baker has once again given his mind to the production of the big single four-stroke. In spite of the fact that the pre-war $4\frac{1}{4}$ h.p. Precision was sold overseas in greater quantities than at home, there are still many admirers of that popular engine in this country who have been looking forward to the appearance of a post-war Precision four-stroke.

Founded on the main essentials of the old " $4\frac{1}{4}$," the new engine is a combination of the most up-to-date practice with the results of years of practical experience.

To begin with, the engine is lubricated automatically by a mechanical pump; and, though a simple supply adjuster is provided, once this has been set the driver is relieved of all further worries. Again, the engine, gear box, and magneto form a single unit, the crank case and gear box being cast together. At the same time, the two units are separated by the walls in such a manner that, but for the constructional advantages, they might as well be two entirely separate units. The mechanism of each is inspected through separate end plates, and no particles of foreign matter from one unit can affect the working of the other.

597 c.c. Cylinder Capacity.

A cylinder of 89×96 mm. bore and stroke is bolted to the crank chamber in the normal way, but the side-by-side valves are mounted in a detachable cylinder head, which has radially disposed cooling fins, and is held down by four set pins.

Within the cylinder lies a slightly waisted cast iron piston with two top rings and one in the skirt which acts as a scraper; double row roller bearings are employed for the big end. Two ball bearings support the crankshaft on the drive side and one on the timing side, and the flywheels are notable for their large diameter and the fact that they are

Transmission side of the new $4\frac{1}{4}$ h.p. Beardmore-Precision. Note the rear springing and upcurved footboards.

forged solid with their shafts, leaving only the crank pin to be assembled. A separate gear wheel, cam, and light rocker are employed to operate each of the adjustable tappets, and a subsidiary exhaust cam is brought into action when required to act as a decompressor.

An eccentric vane type pump is used to circulate the oil on the $4\frac{1}{4}$ h.p. Beardmore-Precision.

Directly below the crankshaft pinion lies a bronze wheel, having a 3 to 1 reduction, which drives a rotary vane type pump, and delivers oil from a sump (formed by a chamber below the gear box and an enlargement of the timing cover) to a regulating chamber which

lies between the tappet guides. A notched quadrant provides several adjustments for regulating the oil flow through a simple needle valve, and oil is delivered from the regulating chamber to the crank case through a ball valve. In addition, a pedal on the exterior of the crank case operates a disc valve, by means of which the crank case can be flushed with oil for racing purposes or in case of emergency. A special crank case breather returns the majority of the otherwise waste oil to the sump, but a small quantity is fed to the primary chain.

Oil regulator and quick thread screw exhaust lifter on the engine.

AN ENGINE-GEAR UNIT.

Driving and timing sides of the combined engine and transmission unit; the cylinder is of 597 c.c. capacity, and the gear has three speeds with clutch and kick-starter.

So short are the centres of the primary drive that no adjustment is provided, since when the chain is stretched sufficiently to cause bad running it should be replaced. The gear box housing is arranged so as to accommodate standard Sturmey-Archer gears, shafts, and clutch, though a modified starter and change-speed quadrant are fitted. The primary chain is almost entirely enclosed by a cast aluminium case, and special provision is made for trapping mud thrown off by the rear chain.

This most interesting unit is housed in a frame almost exactly similar to that already popularised on the spring frame Beardmore-Precision two-stroke. The same type of steel tank forms the main member of the frame. Similar front and rear springing is employed, and no cast lugs are incorporated, all joints and lugs being made of steel pressings welded together where necessary. Both brakes

Advance Details of 1922 Models.—

are of the contracting band type—that on the rear wheel being wide and particularly powerful.

Detail modifications include a pressing to replace the tubular member between the front spindle and the leaf spring, cable guides and pump clips brazed to the tank, and a neat purple panel outlined with blue.

Important Details.

It will be remembered that the mudguards form part of the frame, and that the combined tool-box and carrier are part of the rear guard. Very sensible aluminium footboards with long upward extensions are part of the equipment, and 700×80 mm. or 26×3in. light car tyres are fitted.

It should be emphasised that the engine unit is not a modified 500 c.c. engine, but is designed throughout for its ultimate purpose, and that the complete machine is intended as a competitor to the low-priced light car. As a sidecar outfit, the price of this very fine machine

In addition to the above sports model Beardmore-Precision two-stroke, a similar machine may be equipped with a Barr and Stroud sleeve valve engine.

will be £135, while the solo price will be £105.

The Sports two-stroke will, of course, be continued, and will sell at £75; and

a machine similar in all details, but fitted with a 350 c.c. Barr and Stroud sleeve valve engine (described in *The Motor Cycle* of July 21st), will be listed at £85.

Radco Refinements.

A Larger Engine, a Bijou Sidecar, and a Lady's Two-speed Model.

THE most important alteration to the Radco models lies in the fact that the bore and stroke of the engine have been increased to 67×70 mm. (247 c.c.). The No. 1 model is now fitted with inverted lever controls, Best and Lloyd sight-feed drip lubrication, a modified internal exhaust release, and a neat chain guard; aluminium footboards, Druid forks, C.A.V. or Runbaken magneto, and 24×2½in. tyres complete the specification; though a purple tank, with black and gold lining, is now standard.

Choice of Gears.

This machine may be obtained either single-gear, with plain two-speed, or with clutch and kick-starter. Fitted with a very neat sporting sidecar, the little

Ample dressguards, a low riding position, and a kick-starter make the open frame model suitable for the lady motor cyclist.

machine is one of the lightest forms of passenger machine in existence, and for

dual work a three-speed Burman gear box is recommended.

A second model, with petrol lubrication, 24×2in. tyres, and footrests, instead of footboards, may also be obtained with various forms of transmission; and it is hoped that this machine will sell at an attractively moderate figure.

An Open Frame Model.

The lady motor cyclist who desires an open frame mount has not been forgotten, nor has the need for adequate dress guards on this type of machine. A neat design of frame has been evolved, and, by inclining the engine, it is kept well out of the way of the rider's skirts without being inaccessible. A metal shield extends downward from the tank in the rear of the engine, and both belt and primary chain are similarly adequately protected.

A Burman lightweight two-speed gear box, with kick-starter — a commendable feature on a lady's mount—is fitted, and, otherwise, the machine follows the lines of the standard Radcos.

The 2½ h.p. Radco lightweight outfit is distinguished by a sporting little sidecar, possessing good luggage accommodation in spite of its light weight.

ENGINES FOR ALL REQUIREMENTS.

1922 J.A.P. Models: Side Valves Universal Practice Throughout Wide Range of Singles and V Twins.

THE full range of J.A.P. engines for 1922 will consist of no fewer than ten different models. The makers, J. A. Prestwich and Co., Ltd., Northumberland Park, Tottenham, London, N.17, are particularly anxious that their engines should be known not by their horse-power, as this, of course, is an unsatisfactory term, but by their cubical capacity measurements. The range will be the 250 c.c., 293 c.c., 350 c.c. standard, 350 c.c. sports, 550 c.c., 500 c.c. twin, 680 c.c. twin, the 986 c.c. standard, and the 986 c.c. sports; there is also the 986 c.c. water-cooled twin. Several of these are completely new models. Take, for example, the 350 c.c. sports model, which came into being just before the T.T. races. Unlike several other motor cycle engine manufacturers, those responsible for J.A.P. engines have pinned their faith to the side-by-side valve layout, and have obtained wonderful successes during the past year.

A Long Stroke 350 c.c.

The 350 c.c. sports engine has a bore and stroke of 70×90 mm., and it is now fitted with an oil spray device fixed over the relief valve, consisting of a pipe with a flattened head, and, on each side of the head, are two narrow openings, about ¼ in. in length, through which oil is sprayed on to the valve stems. It would be thought at first that this idea, though excellent, would be rather messy, but very little oil issues therefrom, only just enough to moisten the valve stems. The illustration of the engine will show the multiplicity of the radiating fins and the die-cast aluminium "fir cones" attached to the valve caps which serve

The 550 c.c. J.A.P. single cylinder. Note the die-cast "fir cone" valve cap radiators, the new position of the sparking plug, and the oil spray for the valve stems.

A big twin sports model, specially suitable for speed mounts. It has roller bearing big ends, and ball-bearing mainshaft.

to dissipate the heat. The position of the sparking plug is to the rear of the inlet valve, a position which has been found after careful experiment. An engine, with the sparking plug fitted in the standard position, namely, the inlet valve cap, gave somewhat inferior results, but when the plug was moved to the new position the engine ran for ten minutes on full load and gave increased power. The test was purposely made with unsatisfactory plugs. The new engine has a roller bearing big end and ball bearings on the pulley side. It is also fitted with a new and more robust type of timing

A V twin of 500 c.c., composed of two 250 c.c. single cylinders; the exhaust valve lifter is of the external variety, once popular on all J.A.P. products.

gear. It will be seen that the timing gear case is circular and the magneto chain cover forms part of it, while the platform to which the magneto is attached is of mild steel and is bolted on to a lug on the crank case. The valves are 1½ in. in diameter. When used for competition purposes, an aluminium piston is fitted, but for general touring work a cast iron piston is supplied. Both these are of standard design. The gudgeon pin is held in the connecting rod and rotates in the piston, and it has been found that this system is quite satisfactory, even though, when an aluminium piston is fitted, no bushes are used.

Big Single for Sidecar Work.

The new 550 c.c. engine follows similar lines, and the sparking plug position is the same. The bore and stroke of this engine are 85×95 mm., and it is of the low compression variety. The cylinder has a number of fins cast on it situated close together so as to dissipate the heat adequately, while the new timing gear (similar to the 350 c.c. type) is fitted; the big end has a roller bearing and a ball bearing is used on the pulley side. The piston is of cast iron, and the flywheels are very large.

Another new engine which will attract a number of motor cyclists is the 986 c.c. sports model big twin; this is provided with valve oil spray similar to the smaller engines previously described. The radiating fins have been specially cast to keep heat from the valve chest, and the plug is similarly arranged, where it is cooled by the incoming gases. The size of the ports is also a point worthy of special remark. The valves are 1½ in. in diameter, and 1½ in. exhaust pipes are fitted. Not only are the big ends of the roller

The new 250 c.c. J.A.P. unit. It has an oil spray for the valve stems, the die-cast "fir cone" valve cap radiators, heavy radiating fins, and an improved timing gear.

Advance Details of 1922 Models—

pattern, but ball bearings are used on both sides of the mainshaft. The makers guarantee that this unit will do eighty miles an hour.

The 250 c.c. T.T. Engine.

A review of the new J.A.P. models cannot be concluded without reference to the 250 c.c. engine which this year won *The Motor Cycle Cup* in the T.T., the Grand Prix, all Class A records, won its

Crank case and simple timing gear of the 350 c.c. latest type single cylinder model.

class in the 500 Miles Race, the Gaillon Hill-climb, and the recent world's records in the Paris Speed Trials. It is fitted with side-by-side valves, and it is hoped that it will attain eighty miles an hour. Such a speed from a 250 c.c. single-cylinder is almost incredible, more so since it is equal to the guaranteed speed of the big 8 h.p. twin-cylinder sports model already referred to.

10,000 Revs. per Minute.

Although 80 m.p.h. may seem a vain hope, the makers nevertheless are ready to demonstrate that this wonderful little 250 c.c. engine is capable of turning over at the hitherto-unthinkable speed of 10,000 r.p.m.

There is also a new 550 c.c. sports model, which has one cylinder similar to those on the twin-cylinder sports model, large valves, ball bearings on both sides of the engine, and roller bearing big ends. The 500 c.c. twin is another attractive proposition, and is equipped with two 250 c.c. cylinders, 64.5×76 mm. It is also worthy of mention that the standard 8 h.p. engine has been improved, the cylinders having a larger number of cooling fins situated closer together and roller bearing big ends.

Front driving side view of the 350 c.c. engine, showing the mild steel magneto bracket bolted to the web between the crank case lugs.

"500 Miles" Coventry Victor Marketed.

Replica of Successful Brooklands Mount, a Dual Purpose Touring Model and a Sidecar Machine.

BEFORE winning the 750 c.c. class in the 500 Miles Race at Brooklands, the 5-7 h.p. Coventry Victor had a useful reputation as a reliable and smooth-running double-purpose mount. Now that it has proved also to have a very useful turn of speed, it should meet with much success amongst the more sporting section of the fraternity as well as amongst the tourists who simply admire the absence of vibration characteristic of the flat twin.

For next year, what is to all intents and purposes a replica of the successful racing machine will be marketed as a standard sports model. Reasonable mudguarding and a cover for the primary chain are the chief deviations from the specification of the track machine; and, as this model is of the short wheelbase type (described in *The Motor Cycle* of July 2nd), it strikes one as a most attractive solo mount.

All the characteristics of a successful sports model are embodied in this "500 miles" Coventry Victor.

For a solo or sidecar machine the short wheelbase 5-6 h.p. model is equally suited.

The short wheelbase touring model has more ample mudguarding, footboards instead of footrests, neat new pattern silencing arrangements, and 28×3in. tyres. This machine sells at £115; and the price of the sports model, although not yet definitely fixed, will also be in the same neighbourhood.

Items common to both models are Sturmev-Archer gear box, Brampton forks and spring link chain, Amac carburettor, dummy belt rim front brake, and the new M-L lightweight magneto.

A Cox-Atmos carburettor with an original induction system is optional to those who prefer the single lever control. This instrument has been found to give excellent results on the flat twin engine.

A model with the longer wheelbase (the gear box being behind the rear cylinder instead of underneath) is retained as a purely sidecar mount.

A SIMPLE FOUR-SPEED GEAR BOX.

Four Speeds and Starter in Jardine Box with only Eight Constant Mesh Pinions.

It should not be necessary nowadays to enlarge on the advantages of the four-speed gear box compared with the three. It is generally admitted that the extra ratio is beneficial from all points of view, and on all types of machine; but, on the other hand, it is claimed that the disadvantages of extra weight, bulk, complication, and expense do not merit the adoption of four speeds for motor cycle use. Jardine, Ltd., of Deering Street, Nottingham, have gone all out to prove that the latter school argue on premises that do not exist; and their new four-speed gear box—their only model in future—is certainly less complicated (as our illustrations demonstrate) than many a present day three-speed model; moreover, the price is moderate (£17 10s. retail).

Not an Experiment.

Only in the very ingenious method of obtaining the four ratios with but one sliding dog and no sliding pinions does the box resemble any previous product of the firm; otherwise it has been entirely redesigned on modern lines by a pioneer designer of motor cycle gears, Mr. Cohen, and it represents two years' intensive experiment and labour. Before going on with the description it is worthy of record that plant, jigs, tools, and factory facilities generally are already in action, and indeed that about fifty boxes have been completed to date.

The mainshaft is mounted on double row ball bearings, and, expecting the low gear pinion at the extreme end, which is rigidly splined, the pinions rotate freely on sleeves, which are each provided with integral dogs. Following usual practice, one of these pinions is, of course, mounted on the sleeve which carries the rear chain sprocket. (A belt drive model is not made.)

On the stationary layshaft there are two sleeves, each carrying a pair of pinions, and each being machined out of the solid bar. These layshaft pinions are in constant mesh with those on the main shaft, and the longer of the two sleeves

is mounted on four hardened and ground bushes, provision being made for lubrication. There is also a set of dogs on the bared portion of the mainshaft. No keys are used in the box.

Excepting the control mechanism and the kick-starter arrangements, a double internally dogged clutch completes the inventory of the internal parts. Lateral movement of this dog, bringing it into engagement with the dogs on the pinions and the mainshaft, gives the various gears in their right order. Reference to the diagrams will make this clear, the only involved action being on first or low gear when the drive goes to the layshaft, *via* the low gear pinion, crosses back to a main shaft pinion, returns to the long layshaft sleeve, and thence back to the rear drive sleeve on the mainshaft. Top gear is direct.

The method of sliding and locating the dog is equally ingenious. Rotation (by the control lever) of a sleeve, mounted inside the box, which has a helical slot, gives this sleeve a lateral motion. Another sleeve carrying the dog-operating

General arrangement of the Jardine four-speed gear box shown by a sectional drawing.

fork obtains double this lateral motion by being connected with a second helical slot on the main sleeve. The stub which engages in this second slot is in the form of a spring plunger, and serves the additional duty of locating the gear positions by engaging in grooves on the bar upon which the whole is mounted. No delay action device has been found necessary, and no gate of any sort is fitted. The gears are simply (and easily) "felt" by the long control lever, which, of course, is mounted on the box itself and has a vernier adjustment, so that it may be operated from any convenient angle.

Layshaft Gear as Starter Pinion.

One of the layshaft pinions also acts as a kick-starter pinion, thus leaving only eight gear wheels in the box; incidentally, we are informed that a master patent is held on this scheme of starter operation.

Clutch design and operation is conventional in general principles, but is notable on account of the very large diameter of the plates, and on account of a special thirty-hour treatment which the cork inserts undergo before use. We can

HOW THE GEAR WORKS.

Lateral movement of the double dog engages the various gears, as illustrated. Fig. 1, top (direct drive); fig. 2, third gear; fig. 3, second gear; fig. 4, first or low gear. The thick line shows the path of the drive on each gear. A neutral position is provided between first and second gears.

FIG. 1.

FIG. 2.

FIG. 3.

FIG. 4.

A Simple Four-speed Gear Box.—

testify to the fact that the clutch is extremely "sweet" and progressive in action, and we may also remark here that

There are only eight pinions and one sliding dog clutch to provide the four ratios and the kick-starter gear.

the ease of gear changing compares favourably with any other box on the market.

The casing is a handsome casting, of perfectly clean outline, made in the factory's own foundries, and is provided with a neat inspection door through which the gears can be removed. Chain line and bracket dimensions conform with standard figures on proprietary gears already on the market, while the workmanship and finish are above reproach.

Minor details worthy of note are that all the gear teeth are of the stub pattern, that the rubber buffer for the kick-starter is allowed room for expansion in its housing, and is not merely crushed against a steel wall each time, and that the kick-starter step is of the folding variety.

The weight of the box complete with controls is 34½ lb., and the ratios with a

4 to 1 top are 4, 5.82, 9.22, and 13.4 to 1. Each gear is approximately a 50% reduction.

Exterior view of the complete box with the inspection door removed.

A SPRING WHEEL SIDECAR.

Floating Axle System Tested on Sidecars and Applicable to Motor Cycle Frames.

A NEW form of the popular Middleton sidecar has lately been placed upon the market. Its most noteworthy features are the substitution of the axle tube by a malleable casting of great strength, and an ingenious and simple form of spring wheel.

The spring is circular in form, one end being anchored to a lug on the

The Middleton springing system adapted to a motor cycle.

near side member of the chassis, while the other is fastened to a special carrier pivoted on a large spindle on the side member. The point of anchorage on the wheel spindle carrier is adjustable, so that the tension of the spring may be altered to suit the passenger's weight

Mr. Middleton, the inventor, is so well pleased with the system that he is thinking of incorporating it in a spring fork, and has also applied for a patent for the same system to be employed in the springing of the rear wheel of a motor bicycle. In this case the spindle carrier has an extension at the rear for the support of the back wheel spindle. The point where the springing is rigidly anchored is on the back forks of the motor bicycle, while the carrier is provided with a slide, so that its range of travel is restricted. It should be noted that the point about which the carrier pivots is eccentrically mounted in a housing at the end of the rear forks, so that the adjustment of the rear chain can easily be effected. Delicate adjustment of the tension of the driving chain within fairly wide limits is thus rendered possible.

Tested on Brooklands.

The Middleton spring wheel sidecar has been used a good deal on the track this year. D. R. O'Donovan and C. F. Temple and O. de Lissa have used them at Brooklands meetings.

Another noteworthy feature of the chassis is the extension of the near side member to the rear for the purpose of supporting the sidecar wheel mud-guard, which is anchored at this point

and also at its forward end. This is a well-established feature of the Middleton, and renders the fixing rigid and reliable.

Details of the Middleton sidecar springing:

- A. Stud fixed to chassis tube
- B. Hole where the wheel spindle is fixed in lever
- C. Holes for spring adjustment
- D. Chassis tube, on which lever F pivots or moves up and down
- E. Lug with projecting studs, which is brazed to chassis tube D

Mr. Middleton, whose address is Middleton's Motor Works, 27, Stroud Green Road, Finsbury Park, London, N.4, is also experimenting with a semi-flexible sidecar, which gives just sufficiently to ease the strain on the motor bicycle frame.

Bradshaw Oil-cooled Engines on the Market.

A Range of Power Units; 350 c.c. Single, 500 c.c. Flat Twin, and Two Big 90° V Twins.

ONE exhibit at the forthcoming Motor Cycle Show at Olympia which will attract a great deal of attention and interest is that of J. Walsley and Co. (Preston), Ltd., who are manufacturing the new Bradshaw oil-cooled engines.

It will be recollected that the full description of the 1,000 c.c. 90° V twin with integral four-speed gear, clutch, and kick-starter, first appeared in *The Motor Cycle* of June 30th this year, since when a 1,100 c.c. model has been adopted as the power unit of a new Belsize light car.

Additional to the 90° V twins of 1,000 c.c. and 1,100 c.c. capacity, the latter

with gears incorporated as previously described, there will be shown a 500 c.c. flat twin (the same engine as that already used in the Zenith Bradshaw machine) and a 350 c.c. single-cylinder. All the engines operate on the same principle, having overhead valves working in cast iron air-cooled heads and cylinder barrels submerged in the crank case, through which a large quantity of oil is being passed by a gear-driven pump, the main cooling of the cylinders and pistons being through the agency of oil which gives up the heat to the large areas of the crank case with which it comes in contact.

The cylinder dimensions of the single engine are 68×96 mm. (349 c.c.), this engine being of the long stroke type. The flat twin has "square" dimensions, the bore and stroke being 68 mm. (494 c.c.). The smaller of the two 90° V twins is also a "square" engine, with bore and stroke of 86 mm. (998 c.c.), while the larger one has cylinder dimensions of 90×86 mm. (1,094 c.c.). The complete enclosure of all working parts in the crank case, with consequent silence of operation, will lend the smaller big twin a special attraction when fitted to high speed sporting mounts.

The Starley Semi-disc Wheel.

A Substitute for a Spring Wheel. Three-point Contact.

AS the invention of the originator of the tangent cycle wheel, the latest motor cycle wheel produced by Mr. W. Starley is worthy of special attention, particularly as many of the

A new idea in wheel construction by Mr. W. Starley.

advantages claimed are not obvious unless the construction is carefully studied. In the main, the wheel consists of two discs

of aluminium spun to such a form as to give lateral rigidity. Close to their periphery these discs, when riveted together, form a circle of tubular section, in which are mounted three steel straps, which are held rigidly to the discs by outer metal strips, and form the sole contact between the disc and wheel rim.

Constructionally, therefore, the wheel is simple, light, and comparatively cheap. The advantages claimed in actual practice are many, but perhaps the most important is that the rim is given free play and springs to a certain extent, thereby greatly increasing the life of the tyre and also the rider's comfort. As regards strength, the wheel has been tested both mechanically (by a well-known engineering firm) and on the road, and has so far withstood its trials admirably.

Easier to Clean.

It is obvious that a wheel constructed in this manner will be considerably easier to clean than one of the spoked type, and it has the further advantage that there are no spoke nipples protruding through the rim to cause possible damage to the tyre or to allow the ingress of water.

The discs, being of aluminium, are not liable to rust either inside or out, and the space between the rim and the disc provides free play for tyre levers when repairs to the tyre are necessary.

We are told also that the space surrounding the disc is sufficient to obviate

trouble due to side winds, which is sometimes experienced with full disc wheels.

Another very considerable advantage lies in the fact that Mr. Starley has devised a very simple type of internal-expanding brake, which can be fitted to these wheels in a short time and without

Showing the construction of the Starley semi-disc wheel.

any alteration in the construction of the plain wheel. Details of this brake we are forced to withhold at the moment, owing to the patents being incomplete, but we may state, without divulging the principle, that they are light, simple, and cheap.

An Omega Novelty.

Original Ideas Embodied in the Frame Layout of the New Two-stroke Model.

QUITE one of the most interesting developments in the two-stroke world is the latest Omega model. The whole machine bristles with interest and should attract a considerable amount of attention at Olympia. The engine, which is built by the firm concerned, is of the four-port type, and has a bore and stroke of 71x88 mm. (3.48 c.c.). A hemispherical combustion chamber surmounts a well-ribbed cylinder casting, the ports being of large area. The gudgeon pin floats in the small end bush, and also in the cast iron piston bosses, endwise location being effected by spring rings. All the bearings of the built-up crankshaft are of phosphor-bronze and of particularly large proportions. Carried on the rear engine plates are the magneto and a two or three-speed gear box with clutch and kick-starter, the whole with the aluminium foot-plates forming a compact unit, which may be removed from the frame by uncoupling the petrol and oil pipes and final drive and slacking off three nuts. A very wide duplex loop frame, somewhat reminiscent of that employed by the A.B.C., contains the whole of this unit within its width, so that, in case of a fall, the frame will protect the working parts. Final drive is by belt.

Another novelty lies in the method of carrying the fuel tank, for no screwed lugs are carried by this delicate portion of the machine. Instead, the tank is recessed along its top centre so as to fit round the top rail, the whole being pressed upwards by plates through jack

An Omega model of original frame design. The whole of the power unit, and also the footboards, are inside the duplex frame.

screws carried in special frame lugs.

Detail work includes an exhaust release leading into the exhaust port, the

latter part being well ribbed. Internal V type brakes are fitted. The finish is in black with a red tank panel. Three variations are obtainable: with plain two-speed gear, chain and belt drive, and either two or three-speed gear with clutch and kick-starter, in which case final transmission is by chain. The forks are of a somewhat novel type, the wheels being carried by rods acting in long guides, while the girder portion of the forks is stationary and clipped to the handle-bar on either side of the head. This construction enables a simple type of adjustable handle-bar to be used. Both compression and recoil springs are mounted high up and well out of the way of mud. Pivoted at the peak to a lug on the top tube, the saddle is fixed at the rear in such a manner that it may be reversed in case of leaving the machine in rain so that the seat does not get wet; and another important provision for the rider's comfort lies in the fact that ample legshields are fitted, which serve also to protect much of the machine from mud splashes without interfering with the cooling draught.

The saddle position is particularly low, and yet there is comfortable leg room for a tall rider. In the illustration the leg shields are not shown.

The compact power unit, which embodies a Burman three-speed gear. The bore and stroke of the engine are 71×88 mm. (348 c.c.)

Wide duplex frame used on the new Omega two-stroke. By slackening six nuts the engine, gear, and foot-boards may easily be removed.

Altogether the Omega design is distinctly pleasing, and one which should attract considerable attention when it is exhibited at Olympia. In this machine we have a model designed and produced as a whole, instead of being built with standard units. Frame, fork, and engine are new in design and of Omega manufacture. Its performance in trials will be watched with interest.

A Three-speed Sturmey Lightweight Gear.

Simplified Construction of the 1922 Sturmey-Archer Gear Box for Lightweight Machines.

LIGHTNESS and simplification have been sought in the latest product of Sturmey-Archer Gears, Ltd., of Lenton, Nottingham.

Hitherto makers desirous of offering three-speed Sturmey-gear models of their lightweight machines have been

Neat external appearance characterises the new three-speed lightweight Sturmey-Archer gear box.

Gear wheels of the new Sturmey light three-speed gear; the large low gear layshaft wheel has an internal ratchet for the kick-starter pawl.

compelled to use the heavy box equipped with a light clutch; but next year an entirely new gear will be available, interchangeable in every way with the already popular two-speeder. Incidentally, the weight is only 3 lb. heavier than the latter (18½ lb. in all); and, although a kick-starter is included, no additional pinions are required, for, instead of starting through two separate pinions, the low gear members are utilised for this purpose.

Actually the layout of the gears and the method of operation by sliding both constant mesh middle gear pinions bodily along their shafts is the same as in the heavyweight models; but, by using the low gear wheels as the kick-starter train, the size of the box is considerably reduced by the elimination of the projecting starter case. Methods of control and the single-plate type of cork insert clutch are the same as used on the two-speeder.

French Trials Programme for 1922.

Varied Fixture List, including Road Races and Long Distance Reliability Events.

A PRELIMINARY calendar of motor cycle events to be held in France next year has just been drawn up, and indicates a continuance of the activity which has marked the past season. Many of the events are only of local importance, but about half a dozen stand out internationally. The first event of the year will be a reliability trial, probably a non-stop affair, to be organised by the Union Motocycliste de France, doubtless in the suburbs of Paris. The first event of this nature was run this year in the Forest of Marly, on the western suburbs of Paris. The second trial has been fixed for February 19th.

Argenteuil hill-climb will be held on March 5th. The hill-climb up La Turbie, near Nice, is fixed for March 6th. The Tour de France, which promises to be one of the most important events of its kind for the year, has been settled for the month of March, instead of April.

Paris to the Pyrenees and return will be run from April 28th to May 7th.

The Motocycle Club de France will hold its road races, on a course yet to be decided, on June 4th and 5th. On the 11th of the same month there will be a cycle car race organised by the Cycle Car Club. The big road race of the year, for which the national body, the Union Motocycliste, will be responsible, has been fixed for July 16th. There will be no important events in August, in order not to clash with the Six Days Trials. Gaillon hill-climb will be run on October 1st, and on October 29th there will be a one day reliability trial around the suburbs of Paris.

Some of the local French clubs are of the opinion that official expenses in connection with races and competitions are unnecessarily high. Thus the Motocycle Club de France states that the services of two timekeepers at the race held at

Provins, near Paris, last summer cost 510 francs, or at normal exchange about £20. The cost of two timekeepers for the Paris to Nice competition was 1,813 frs. 80 cents, or nominally £72. It is stated that when the recent speed trials were held in the Bois de Boulogne an offer was received from England of the use of an electrical timing apparatus and the services of an official timekeeper free of cost. The Motocycle Club de France had to refuse this offer on account of a vigorous protest by the national authority in France. In this connection it is pointed out that the winner of the non-stop trials held in the Forest of Marly last March has not yet received the medal offered by the Union Motocycliste.

The local clubs claim that the expenses of officials should be kept as low as possible in order that motor cycle events may be held with lower entry fees than have to be applied at the present time.

Times to Light Lamps.

Number-plates to be illuminated thirty minutes earlier, vide Road Vehicles Registration and Licensing Order (1921).

November 28th.

Eighteen more days and Olympia will open its doors to the motor cyclist.

The Motor Cycle Film.

The *Motor Cycle* film, which will be loaned to clubs during the winter months, will be released during the motor cycle Show week, when it will be shown twice daily at the Polytechnic Picture House. See page 582.

Near Football Grounds.

A Liverpool motor cyclist was recently summoned for a breach of the traffic regulations which, in this particular instance, closed certain streets adjacent to a football ground during matches. It appears that the defendant could not reach his house and shop without contravening the regulations. The Stipendiary questioned the validity of the regulation, and the charge was withdrawn.

Two-stroke Lightweight Performances.

In the West Midland open trial reported on page 585, an outstanding feature was the climbing of some of the smallest two-stroke lightweights. The manner in which the Sun-Vitesse team and the two Morris machines performed was particularly noticeable, and quite outclassed many more powerful machines, while the O.K. and Velocette sidecars are the wonders of their kind.

ORDER TO-DAY!

The Autocar

SHOW REPORT

On Sale FRIDAY,
November 11th, 1921.

Excursions to the Motor Cycle Show.

Excursion trains on pre-war lines will be run to the Olympia motor cycle show.

Show Report Number of "The Autocar."

An issue of extraordinary interest is the Show Report Number of *The Autocar* published to-morrow (Friday). Students of car design will find the contents of compelling interest, for, in addition to a technical survey of 1922 cars revealing progress in design, there is a stand-to-stand description of the Olympia and White City exhibits, with specifications of each type of car, and hundreds of line and half-tone illustrations. *The Autocar* Show Report is an issue worth preserving. Copies should be ordered to-day—fourpence.

Special Features.

100 MILES RACE IN SOUTH AFRICA.

INNOVATIONS IN DESIGN.

ROAD TEST OF OIL-COOLED TWIN.

Hotel Accommodation for the Show.

Provincial members of the A.C.U. may obtain assistance in securing hotel accommodation during Show week from the secretary of the Union.

Original Valve Timing.

In reply to a motoring query to the *Statesman* (India), a reader is advised that the exhaust valve should close "when dead centre is reached five minutes past midday." In other words the engine attains 365 revolutions per year!

Next Thursday.

The next issue of *The Motor Cycle* will be the first of the three special Show numbers, and will be devoted chiefly to passenger machines.

Novelties for Next Year.

In this issue are described two designs for 1922 which justify the term "novelty." One is a very simple four-speed gear box, and the other a most unconventional spring frame. Both have passed the experimental stage.

AT BROOKLANDS ON SATURDAY.

A photographic impression of speed in the only sidecar race. The riders are R. Charlesworth (5-6 Zenith sc.) and E. Bridgman (7-9 Indian sc.) D. H. Davidson on a similar machine to Bridgman's won this event.

RUNABOUT ENGINE TENDENCIES.

Developments in the Design of Small Four-wheelers.

By a Motor Cyclist at the Car Show.

CARDEN. Air-cooled two-cylinder two-stroke, gear drive.

LECOY. Air-cooled J.A.P. engine, friction transmission.

NEVER before has the exhibition of cars at Olympia and the White City held so much of interest to the motor cyclist. There are more and better cycle cars and light cars on view than in previous years, and the range extends from the simplest possible form of four-wheeled runabout with a single-cylinder air-cooled two-stroke engine to the perfect miniature car having a four-cylinder water-cooled engine, three speeds and reverse gear, and shaft drive to a full floating rear axle. Almost every variation between these extremes is to be found.

Pioneer Small Cars.

Many salient features are bound to be of interest to those who are unable to visit the Show. One of the most interesting developments is the entry of France into the field of very light cars. Strictly speaking, France has been nibbling at the type for some years past, and such little machines as the baby Mathis and Peugeot are old friends; the latter has become the Peugeot Quadrilette, and in its latest form with staggered seats instead of tandem accommodation it will make a strong appeal. Now, however, we have a number of newcomers represented in this country, mostly of the miniature car type, such as the Salmson, M.A.S.E., Talbot, and the 5 h.p. Citroën. The last mentioned is a fascinating little vehicle, having a four-cylinder water-cooled *monobloc* engine of 855 c.c., built as a unit with the three-speed and reverse gear box. That well-known firm of engine builders, Messrs. Chapuis-Dornier, have also found it worth while to exhibit a tiny four-cylinder engine and gear unit.

It must, of course, be remembered that the French invasion is only following in the footsteps of many British firms such as the Singer, the Standard, and Stellite, who are also in this class, who were pioneers of the type in this country. There are not many foreign competitors in the smaller classes, but the Kiddy shown on the Bignan stand is an exception. This little machine has a tiny flat twin air-cooled engine of 65x60 mm. bore and stroke, a two-speed and reverse

gear, and shaft drive. Enclosed overhead valve gear is fitted. Of British flat twins there are a number. The water-cooled Jowett was a pioneer, and the water-cooled Bovier is fitted, amongst others, to the Unit and Corona light cars; and the 7 h.p. Wolseley is an interesting newcomer with a big reputation behind it. Air-cooled flat twins are perhaps best exemplified by the A.B.C. and Rover, though a little Gibbons cycle car is also thus engined. The new Hotchkiss engine is also

A.V. Air-cooled J.A.P. engine, chain drive.

a very fine piece of work. Water-cooled V types are exhibited by the Crouch, Coventry Premier, and Little Midland, the first mentioned being an interesting engine with enclosed overhead valve gear. The Coventry Premier, it will be remembered, was a three-wheeler last year.

Air-cooled Engines.

Air-cooled V twins are still the most popular type amongst the lighter and more moderately-priced vehicles. J.A.P. and Blackburne engines predominate in this class, and, in addition to the well-known A.V., Tamplin, Blériot-Whippet, and G.N., there are new adherents, such as the Swallow, with shaft drive and epicyclic gear, and the Lecoy, with its unusual body and friction drive.

GIBBONS. Coventry Victor flat twin engine, chain-cum-belt transmission.

TAMPLIN. Air-cooled J.A.P. engine, all chain transmission.

Small Engine Tendencies—

The latest Blériot-Whippet has all chain drive, with a three-speed and reverse gear box, and is a very attractive little machine, its luxurious suspension being one of its strongest points. New A.V. models include a family type body and several interesting refinements, while the latest side-by-side-seated Tamplin is almost the last word in simplicity, combined with comfort and economy. As an example of the future possibilities of the air-cooled V twin, the B.S.A. is most striking. In this chassis, which is replete with every modern convenience, including electrical starting, we find an overhead valve engine with entirely enclosed valve gear, pump lubrication, unit engine, and four-speed gear box. The price is rather higher than the average motor cyclist can afford; but, as an admirable example of air cooling, it is a matter of interest.

In a class by itself is the new Belsize, fitted with a V twin engine having air-cooled heads and the Bradshaw oil-cooling system applied to the rest of the engine. Side-by-side valves are employed.

The White and Poppé engine was shown in the Gallery. As regards transmission, there seems to be a slight tendency in the direction of the shaft drive in the lighter classes throughout, though quite an imposing array of friction transmission is staged. The Short-Ashby, one model of the Unit, the G.W.K. (a revived two-cylinder model will be of special interest), Lecoy, and New British (with air or water-cooled V twin engine) are interesting examples. The popular G.N. with its shaft and chain transmission remains unaltered, except for lubrication and starting arrangements; but belt transmission has almost entirely disappeared.

"THE MOTOR CYCLE" FILM.

IN addition to illustrating the enthusiasm of motor cycle clubdom, the reception which has been accorded *The Motor Cycle* film demonstrates one or two other interesting facts. The number of clubs which count managers of popular cinemas among their members is remarkable, as is also the ease with which the clubs less fortunate in this respect are arranging for the exhibition of the film in the leading cinemas of their towns.

We have received a number of congratulatory letters from various clubs, for which we take this opportunity of making public our thanks.

No fewer than fifty applications have already been received for the film, and at the time of writing twenty-two clubs have already been allotted definite dates. Many others are now completing their arrangements, and the latter total should be greatly increased by next week.

As announced last week, the length of *The Motor Cycle* film is 1,767ft., made up as follows:

Senior T.T. Race	395ft.
Junior T.T. Race	436ft.
French Grand Prix	148ft.
A.C.U. Six days Trials	346ft.
500 Mile Race	442ft.

It is expected, however, that an additional 300-400ft., including incidents in the recent 200 Miles Race for small cars, will be added before the film is released.

The following clubs have been allotted dates, but it should be noted that the majority of the intermediate dates are being reserved for other clubs which have applied and are now completing their arrangements:

Dec. 7.—Cheltenham and District M.C.C.	
" 8.—Gloucester M.C. and L.C.C.	
" 12.—Princess Mary's Convalescent Centre, Rednal.	
" 15, 16, 17.—Glasgow Western M.C.C.	
" 19, 20, 21.—Worcester and District M.C. and L.C.C.	
" 23, 24.—York and District M.C.	

Jan. 1.—Barrow and District M.C.C.	
" 5.—Cardiff M.C.C.	
" 9.—Dewsbury and District M.C.C.	
" 11.—Clitheroe and District M.C.C.	
" 18.—Liverpool M.C.	
" 20.—Newcastle and District M.C.	
" 23.—Oxford M.C.	
" 25.—Keighley M.C.	
" 26.—Bradford M.C. and L.C.C.	
" 27.—Peterborough M.C.C.	
" 30.—Newport County M.C.C.	
Feb. 2.—Stocksbridge and District M.C.C.	
" 23.—Eastern Valley M.C.C.	
" 24.—Gorseinon and District M.C.C.	
Mar. 2.—Aberdeen and District M.C.C.	
" 4.—Wellingborough, Rushden, and District M.C.C.	

In addition to the above, the following clubs have either applied or acquainted us with their intention of applying at an early date:

Colne, N.W. London, Chorlton-cum-Hardy, Glasgow, Herts, Chester, Lancaster, Morecambe, Blackpool and Elyde, Leinster, Central Cornwall, Sheffield and Hallamshire, Oxford, Mansfield, Wellingborough, Rushden, Derby, Marlow, Aberdare, Cork, Lewis Athletic, Ilkley, University College of N. Wales, Redditch, Standard (Coventry), Triumph (Coventry), Builth Wells, Kirkby Stephen, Annfield Plain, Gloucester, Cardiff, Birmingham, Rotterdam, Hull, and Portsmouth.

LADY RIDER'S 1,000 MILES TRIAL OF THE NER-A-CAR.

AN enthusiastic reception was accorded Mrs. G. M. Janson at Barnet on Saturday evening when she completed a 1,000 miles engine non-stop trial on the latest model Ner-a-car. Spectators at Highgate, the anticipated finish, were deprived the pleasure of witnessing the spectacular arrival of this plucky lady, escorted by a fleet of machines similar to that undergoing the test.

Rain and cold winds, entailing a severe skid at one point during the run, have been Mrs. Janson's misfortune; the comparatively clean condition of the machine at the finish, however, adequately demonstrated the efficiency of the large mudguards, whilst the rider herself, warmly clothed in a leather coat and spats have suffered little from the effects of wheel splash. She is to be congratulated on having completed a daily average mileage of 190 miles. The machine has done remarkably well, inasmuch that no trouble has been reported by the A.C.U. official observers, Messrs. C. J. Cuffe and J. M. Barr.

Due praise must be given the rider who, when the machine skidded, had the presence of mind to disengage the clutch in order to keep the engine running. In this she was successful.

The weight of the Ner-a-car is just under 2 cwt., whilst the rider increases this by 8 stone 6 lb.

Mrs. Janson after the 1,000 miles A.C.U. officially observed test of a Ner-a-car. The photograph was taken at the old Gate House, Highgate.

MIXED RACING AT BROOKLANDS.

J. Hall (3½ Norton) and S. L. Bailey (3½ Douglas) "fall out" in the 500 c.c. handicap. C. P. Wood won this race on a Scott-Squirrel.

Three-Lap Handicaps and a 750 c.c. Championship.

FOR the first time in its history the British Motor Cycle Racing Club has held a meeting in November. It is hardly a practice we should recommend, but luck favoured the club on Saturday last, as, after three wet days, the weather, though autumnal, was fine. The three-lap handicap for solo machines not exceeding 500 c.c. attracted thirty-nine entries, of whom twenty-two started. A revival of an old idea was to be seen on Pullin's two Douglases and Stewart's Trump. It originated in the old Gillet-Lehmann carburetter, and consists of connecting the carburetter air inlet to the float chamber or the tank, or to both, so that a pressure feed is obtained to a certain extent. The ordinary air funnel tends rather to blow the petrol

back into the jet than to force the mixture into the induction pipe. Pullin's Douglas had a large pressure box fitted round the air inlets of his two carburetters.

During the start Pullin got away rather badly. Le Vack stopped after leaving the starting line, while Remington let in the clutch of his Blackburne so violently that the machine reared in the air and flung his assistant on his face on the track. Tollady (Velocette), the limit man, held his own comfortably on the first lap, while Watson (Douglas) was second, and Greening (Francis-Barnett) third. "No. 13," James (Norton), retired in this lap. Halford (o.h.v. Triumph) was travelling well, but with only 12s. start he had to open up to keep among the leaders, Wood (Scott-Squirrel) was running eighth, buzzing like a gigantic bee.

A Two-stroke Win.

In the second lap Tollady still kept his lead, but Wood had shot forward to second place, Longden (Coulson) was third, and Halford was falling behind.

In the final lap, Wood, Longden, and Halford crept past the Velocette rider, Wood being an easy winner at a speed of 74.57 m.p.h. Results:

START.

	M. S.
1. C. P. Wood (3½ Scott Squirrel)	1 9
2. E. Longden (3½ Coulson)	1 42
3. F. B. Halford (3½ Triumph)	2 12

Also ran: J. W. Tollady (2½ Velocette), D. H. Davidson (3½ Indian), and J. V. Prestwich (2½ Omega-Jap).

There were nineteen entries for the next event, a three-lap handicap for 500-1,000 c.c. machines, and only four non-starters. Lord (on a Sports Humber) made an excellent start with his clutch, Davidson

C. P. Wood on the Scott Squirrel, which he piloted to victory in two events; in one his speed exceeded 76 m.p.h.

(Indian) was rather slow off the mark, while Temple (Harley-Davidson) stopped his engine after leaving the starting line. Lord held his own easily in the first lap, Stewart (Trump-Jap) was second, and Bainbridge (B.M.) was third.

In the second lap Stewart led, with Hørsman second, and Remington third, while Le Vack was in fifth place.

C. G. Pullin, who won the 750 c.c. championship race on a 3½ h.p. Sports Douglas at a speed of 76.49 m.p.h.

Mixed Racing at Brooklands.—

The result was an easy win for Le Vack whose Indian ran magnificently. Winner's speed, 89.1 m.p.h. Results:

	START.	M. S.
1. H. Le Vack (7-9 Indian) ..	0	13
2. E. Remington (8 Blackburne) ..	0	19
3. R. N. Stewart (5-6 Trump-Jap) ..	1	30

Also ran: V. Horsman (4 Norton), C. G. Pullin (5 Douglas), and R. Charlesworth (5-6 Zenith).

The next race was another three-lap handicap, this time for sidecar outfits and cycle cars with engines not exceeding 1,000 and 1,100 c.c. respectively. The latter class was represented by E. B. Ware's Morgan and Marchant's original Blériot-Whippet with belt drive.

James (Norton sc.) made an excellent clutch start; Le Vack had to push hard to get his engine to fire; and Ware and Temple (Harley-Davidson sc.) were sent off together, but of the two Ware was easily the faster. F. A. Longman (Ariel sc.), the limit man, led at the start, and then followed: James (Norton sc.), Dequin (Zenith sc.), and Tucker (Norton sc.). Ware was travelling well, and looked like business. In the second lap Tucker took the lead, having gained a place over

Longman, while James ran third. Bridgman (Indian sc.) was running fifth; Ware had the speed, but had trouble in finding room to pass. The result was a remarkably close finish between the first two men, while the third man was only about two lengths behind, and the fourth not far away. The winner's speed was 70.28 m.p.h., and the race was a veritable Indian triumph. Results:

	START.	M. S.
1. D. H. Davidson (7-9 Indian sc.) ..	0	27
2. H. Le Vack (7-9 Indian sc.) ..	scr.	
3. E. Bridgman (7-9 Indian sc.) ..	1	3

Also ran: G. W. Tucker (3½ Norton sc.), R. Dequin (8 Zenith sc.), and E. B. Ware (8 Morgan-Jap).

Next came the five-lap championship scratch race for motor cycles with engines between 500 and 750 c.c. All made an excellent start, forming a pleasing spectacle after the previous handicap events. Pullin, Bowen (Martinsyde), and Gifford (Martinsyde) were the three leaders in the first lap. In the second and third laps Bowen was the first man over the line; while Gifford, Horsman, and Stewart brought up the rear, and never changed their positions. In the two final laps Pullin again assumed the lead, and

his Douglas gradually gained ground. His speed was 76.49 m.p.h. Results:

1. C. G. Pullin (5 Douglas).
2. H. H. Bowen (5-6 Martinsyde).
3. E. H. Gifford (5-6 Martinsyde).

Also ran: V. Horsman (4 Norton) and R. N. Stewart (5-6 Trump-Jap).

76½ m.p.h. on a Scott.

A winner's three-lap handicap, open to the first four to finish in Events 1, 2, and 3, brought the meeting to a close.

In the first lap the limit man, Tucker (Norton), was passing as Le Vack left the line. Bridgman (Indian sc.) and Longden (Coulson) came next in close order with Horsman (Norton) third; but C. P. Wood's Scott was clearly a danger, and before the finish the Scott's wonderful note was heard in the distance, and not a few were surprised to see him finish an easy winner at 76.43 m.p.h., while Davidson and Halford had a fine struggle for third place. Results:

	START.	M. S.
1. C. P. Wood (3½ Scott) ..	1	15
2. V. Horsman (4 Norton) ..	1	24
3. D. H. Davidson (7 Indian) ..	1	12

Also ran: F. B. Halford (3½ Triumph), E. Bridgman (7 Indian sc.), and E. Longden (3½ Coulson).

ORIGINALITY IN A SPRING FRAME.

The Mackechnie-Coventry Victor which will make its Début at Olympia.

CASUAL observers of motor cycle development may be excused if they remark that spring frame design has gone into a groove nowadays, and that the designs which do break away from the conventional seldom get further than the Patent Office. With one or two notable exceptions, the observation is, unfortunately, true. It is therefore distinctly encouraging to encounter a promising new suspension system, which has survived its early road tests with honour, and which has now reached the marketable stage.

The machine which embodies the system in question, the invention of Col. Mackechnie, is being built at the works of Morton and Weaver, Ltd., Coventry, makers of the 5-6 h.p. Coventry Victor engine, with which it is fitted. It will be shown at Olympia as the Mackechnie Coventry Victor.

Remarkable Qualities.

Perhaps the three chief advantages of the Mackechnie design are (1) that lateral instability of the rear wheel is no more

possible than on a rigid frame; (2) that the single 4ft. long leaf spring permits more than 4in. up and down vertical movement to the sprung portion; and (3) its promise of almost indefinite wear with a minimum of attention. These qualities are gained as follows:

Two pairs of slightly curved and cross braced tubes extend from the steering head to the rear axle, forming a cradle rigidly connecting the rear wheel to the head of the machine.

The engine is carried in a sub-frame, hanging between the main longitudinal members, and is slung from the centre of a five-leaf semi-elliptic spring which extends from a cross brace behind the steering head to the bridge of two vertical stays pivoting near the rear axle. Also, on this sub-frame are carried the petrol tank, Sturmey-Archer gear box and footrests, and mounted on the spring at the point of attachment is the saddle, which thus moves directly with the footrests. The chain stays are pivoted behind the gear box bracket, and at their rearward extremities—in both cases on Skefko self-

aligning ball races. Incidentally, although the range of movement of the sprung portion is unusually great, only a very slight deviation of the chain stays takes place. As these are also well braced, there should be no cause to fear lack of lateral rigidity of the engine unit at this point.

Provision is made for lubricating the substantial mounting for the spring in front, and at the rear it is pinned to a cross-piece, which, on future models, will be carried in "oilless" graphite bushes. As the spring is so securely carried, and of such massive dimensions, there is no danger of the upper portion of the sub-frame developing side play.

Transmission Variations Slight.

Variations in transmission tension are so slight as to be quite negligible with the Brampton spring chain fitted, while the even torque of the 5-6 h.p. Coventry Victor flat twin engine adds to the exceptional comfort of the machine, as we discovered on trying the first machine within half an hour of its completion; and considering its newness, it gave a very fine impression of comfort combined with security, particularly at high speeds.

In detail specification this machine resembles the touring model Coventry Victor, 28×3in. tyres, dummy belt rim brakes on both wheels, Best and Lloyd latest type drip feed, M-L lightweight magneto, and Amac carburettor being standard. There is only a slight increase in weight, and the selling price, although not yet fixed, will similarly be not much greater.

Modifications which will be made in the future include a gaiter for the spring and combined engine and legshields, which may be conveniently fitted to the outside of the main frame members, thus shielding the rider from the flywheel and exhaust pipes.

A SPORTING DAY IN THE MIDLANDS.

Midland Centre (A.C.U.) Autumn One-day Trial. Sixteen Teams of Three Riders compete for "The Motor Cycle" Prize.

PROBABLY the most unusual feature of last Saturday's West Midland Centre open trial was the manner in which some of the old hands failed to distinguish themselves, while certain other riders, neither familiar in competition nor trade circles, made excellent performances on the worst obstacles of the day.

The route was a difficult one over which to average 20 m.p.h., because it lay through an almost endless succession of undulating, winding, and greasy lanes.

Stewponey Hotel, between Kidderminster and Wolverhampton, was the scene of the nine o'clock start, and after about eight miles of fairly easy going, the string of eighty competitors found themselves faced with New Walton Hill, a kind of back-stairs ascent of the Clent Hills, near Hagley. The lower portion of the hill was merely a narrow, greasy road of no particular gradient, which debouched on to an open triangular patch of nettles and shrubbery; the road bounded this patch, taking the most acute angle, of course, and immediately afterwards followed a steep rise to the summit, where the gravel surface deteriorated into a grass track.

Solo Riders in Difficulties.

Out of the first batch of forty-five soloists only four negotiated the lower hairpin without violent correction of skids by foot slogging. These four riders were R. W. Duke (4 Triumph), C. Greenwood (3½ Sunbeam), A. Milner (2½ O.K. Junior), and W. L. Handley (2½ O.K. Junior). True, the surface of the bend was greasy

On New Walton hairpin. L. Newey (6-7 Ariel sc.) passes ahead of F. W. Giles (6-7 Ariel sc.), who attacked the hill too fast and skidded completely round.

and muddy in the extreme, but the approach was good, and there was a firm patch beyond on which to "straighten

up" and attack the gradient with wheels in track once more; moreover, after the place had been churned up by the bulk of the entry—solos, sidecars, and cycle cars—two tail-end soloists came along, L. Cox (2½ Sun-Vitesse) and F. Whitworth, jun. (3 Ivy), and made perfect "corners."

Apart from the six above-mentioned, everyone else footed to greater or less degree; amongst the latter may be mentioned G. F. Mason (2½ Connaught), M. Bishop (2½ Sun-Vitesse), A. R. Edwards (2½ Levis), and the two Smiths, A. K. and G. S., on 2½ h.p. Morris machines.

B. Kershaw (2½ New Imperial) and the Rev. J. M. Phillpot (2½ Velocette) made brave efforts to keep their feet on the rests. D. G. Prentice (2½ New Imperial) performed some most involved "figure skidding," while A. A. Symes (3½ Martinsyde) made a complete turn, rode down the hill, turned again, and struggled through at the second time of asking.

Sidecarists at Ease.

The sidecars experienced little trouble; W. L. Danskin (7-9 Rudge sc.) and F. S. Sibley (7-9 Rudge sc.) made splendid ascents, and L. Newey (6-7 Ariel sc.), J. T. Bashall (6 Martinsyde sc.), and T. Peck (4½ Ariel sc.) were all excellent, while N. Hall (2½ O.K. Junior sc.) and G. Denley (2½ Velocette sc.) made wonderful ascents. H. Greaves, on the new 4½ h.p. Beardmore-Precision outfit, was also good, but he was not much in evidence later in the day. The only actual failures were S. R. Philpott (6 Martinsyde sc.)

B. Kershaw (2½ New Imperial) leading D. G. Prentice on a similar machine on the lower portion of High Oak Hill.

R. W. Duke (4 Triumph) crossing the watersplash at the foot of High Oak Hill—his performance was outstanding at this point.

and an 8 h.p. Rover car, but F. W. Giles (7 A.J.S. sc.) made an exhibition almost unbelievable in a rider of such experience; he approached the left bend much too fast, got the sidecar wheel in the air, turned right, and narrowly missed an observer's car in a near-by lane, rushed up the hill again into the worst portion of the mud, and only got out by the most violent exertions.

After this point was a badly observed hairpin on a down grade (hereabouts unfortunately several went astray), then Beacon Hill and its hairpin were tackled before easier going was reached and Bromsgrove and Kidderminster traversed on the way back to the Stewponey Hotel for lunch.

Restarting from Cold.

After the lunch stop, a starting from cold test was made, riders not being allowed to do anything but turn on the petrol until the word to go was given; this test was well carried out, and the majority started within the ten seconds required.

The special test of the afternoon was High Oak Hill, not far from Bewdley. It is the "discovery" of a local farmer, who is also a keen motor cyclist, and is of great difficulty, being approached through a small watersplash; the rideable surface is greasy, stony, and just wide enough for sidecar outfits.

Most took the splash steadily, the only real exception being J. G. Nickson (3½ Douglas), who accelerated violently on sight of the water. A. Rollason (3½ Ariel) failed through belt slip on the gradient, and W. E. Jackson (2½ Bown-Blackburne) petered out. L. Nicholson (2½ Omega) ran alongside, and A. Milner (2½ O.K. Junior) paddled up the hill, smoking a cigarette the while. Two outstanding performances, on the lower portion of the hill at any rate, were H. J. Stretton Ward (4 Triumph) and F. S. Barnes (3½ Sunbeam), and, higher up, King Smith

(2½ Morris) and H. W. Parkes (2½ Sun-Vitesse).

The sidecars were not nearly so fortunate. W. L. Danskin (7-9 Rudge sc.) and J. E. J. Whitaker (8 Matchless sc.) failed together with a deranged gear box and wheel slip respectively, and badly baulked F. T. Sibley (7-9 Rudge sc.), who made a fine attempt to get through. Giles (7 A.J.S. sc.) again gave an exhibition of "strenuousness" and exaggerated jockeyship in strong contrast to L. Newey (6-7 Ariel sc.), who followed him, making a perfect climb, with the passenger normally seated and no fuss. J. T. Bashall's passenger fell off the 6 h.p. Martinsyde sidecar, and, clinging manfully to the carrier was dragged to the summit, Bashall declining to stop, and the passenger refusing to let go!

T. C. de la Hay (3½ Sunbeam sc.) came up at great speed, regardless of choosing the best course; but R. Brown, on a similar machine, had wheel slip, and failed. S. Goodwin (10 Castle Three) climbed well, and Norris and Carr, on Morgans, roared over the gradient, thanks to Parsons chains, as did Cave on the G.N. cycle car. Hall and Denley on the O.K. and Velocette miniature sidecars were again outstanding performers.

Stopping and Restarting.

After the check at Abberley came Flagstaff Hill, with a stopping and restarting test, but the gradient only claimed eight actual failures.

Forty miles still had to be covered, *via* North Clebury and Bridgnorth to the finish at Stewponey, and detours were made to include Furnace Mill Hill and Farlow Bank. This last section was as nothing after High Oak, which had hardened the competitors to anything.

Taken as a whole the trial was an excellent one, organisation and route marking were thorough, and the secretary's programme wish, "May it rain like the deuce," was mercifully unfulfilled.

Special Tests.

The figures (in seconds) for the starting from cold test (after lunch hour) and stopping and restarting on Flagstaff Hill are given below; 10s. without penalty was allowed in the former, and 15s. for restarting and crossing a twelve yard mark in the latter. Only times outside the allowance are shown.

(Original Patentees and Manufacturers of Bowden Wire Mechanism).

YOUR NEW MACHINE

You probably want one that will start easily, run slowly and smoothly on top gear, open out with the flexibility of a steam engine, develop full power on hills, and give the maximum all out speed, and hold it.

The first essential after selecting the make of machine is to see that it is fitted with a Cox "Atmos" Carburetter, which will give you—not one or two of the above benefits—but the whole lot, under the control of one lever.

On motor cycles, cars, and motor boats the Cox "Atmos" has proved its superiority times innumerable. Further, it keeps your engine in better tune for a longer period.

The Cox "Atmos" is not a cheap carburetter, but even so a number of manufacturers have decided to fit it as standard for 1922, and others are proceeding with tests.

Our Booklet "Public Opinion" is worth reading — Post Free on Application.

and all motor cyclists.*

MOTOR CYCLE REMINISCENCES

By
"IXION"
of
"The Motor Cycle"

This entertaining book ranks as one of the best things "IXION" has ever done. It not only gives an amusing record of the author's own motor cycling experiences and misadventures, which began nearly twenty years ago, but it contains also a great deal of very interesting motor cycle history, covering, as it does, all the great rides of the early days, from the first End-to-End ride in 1902, and all the important French races.

The writer has drawn upon a well-stocked memory to good purpose, and produced a work which will appeal

strongly to all motor cycle enthusiasts. None can read it without laughter, yet under the author's whimsical style there will be found a mass of instructive facts, bringing into sharp relief the wonderful progress that has taken place in motor cycle design.

The book is appropriately illustrated, and in addition to a unique collection of photographic reproductions of early machines, events and rides, it also contains 14 specially prepared drawings of a humorous character.

MOTOR CYCLISTS

The best garage is your own

A GARAGE of your own means longer life for your motor cycle. Moreover, if you erect a B. & P. Motor Cycle House beside your residence, you save garage fees.

B. & P. Motor Cycle Houses are carefully constructed of the finest materials. They are absolutely weatherproof and will last intact for years.

Get in touch with our Advisory Department, who will give you interesting details of the Motor Cycle House (illustrated below).

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—First 12 words 3/-, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.,** and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue. Advertisements that arrive too late for a particular issue or that are crowded out will automatically be inserted in the following issue unless accompanied by instructions to the contrary.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMERICAL ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box no., c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. Readers who reply to Box No. advertisements are warned against sending remittance through the post except in registered envelopes; in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor. Carriage is to be paid by the buyer, but in the event of no sale each party pays carriage one way. The seller takes the risk of damage in transit. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, 1/-. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

WE DEFY COMPETITION.

STANDARD STOCK

NOT MARKED CLEARANCE

We have purchased a large stock of these covers at a greatly reduced figure owing to the makers discontinuing this pattern. Our goods must not be confused with similar lines offered by other firms who are offering this make of tyre branded "CLEARANCE."

Owing to the exceptionally low figure, these covers are offered you, it is impossible for us to give our usual guarantee. We are prepared to consider any complaints should occasion arise.

Philipson's

PATENT AUTOMATIC GOVERNOR.

PULLEY

AND GEAR COMBINED.

Philipson's Latest!

GOVERNOR PULLEY AND GEAR COMBINED WITH FLY WHEEL for all two-stroke engines.

The Lightest, Speediest, and Simplest Gear on the market for direct belt-driven 2-stroke and 4-stroke engines.

ONLY adds 2 lb. (approx.) to the weight of a 2-stroke machine, and 6 lb. (approx.) to the weight of a 4-stroke machine.

During the past week we have fitted the following machines:

2-stroke.	4-stroke.
LEVIS,	TRIMPH,
O.K.,	NORTON,
CALTHORPE,	ROVER,
VILLIERS,	SINGER,
etc.	etc.

We are now in a position to supply the Philipson Pulley to fit J.A.P. engines without any alteration to the machine or "staggering" of the engine.

Our Flywheel Governor converts a single-speed 2-stroke into a speed model—the lightest speed model on the market!

THE ONLY GEAR WITH NO END THRUST.

IMMEDIATE DELIVERY.

Send for Illustrated Booklet.

No gear box friction.
No grinding noises.
No wheels or pinions to chew up.

Shelley**, Manor House, Titonsor, Staffs. [6368]

MORE PEP

Do you appreciate power, good oil and petrol consumption, better compression, and an engine that does not carbon or gum up? If so, you must fit these patent Rings. Users say, "The difference is remarkable." Racing men say, "They are IT." Yet they cost about the same as old-fashioned rings. For 2½ h.p. Douglas, 1/6 each; 4 h.p., 1/8 each.

A REAL SNIP.

Metal-armoured Tool-bags. Two straps. Beautifully constructed and reinforced. Large size, for 4 h.p. Douglas, 12/6, usual price 20/-; 2½ h.p., 9/-, usual price 11/-. A very limited supply. Money back if not satisfied.

A NEW SADDLE.

Giving a low, natural seat, adjustable springs, real leather, does not foul the 4 h.p. Douglas sidecar stay. Guaranteed. 25/-, usual price 35/- 50 only left.

ENGINE COOLERS.

2,000 of these wonderful alloy air-cooled Caps for 2½ h.p. and 4 h.p. Douglas have already been sold. They prevent knocking on long hills and drying up. Did you notice the T.T. riders and the Grand Prix winners had them fitted? You must have these; they only cost 4/- each, and add to the appearance of your machine.

BARREL VALVE SPRINGS.

These springs prevent bouncing, and lighten the work on the cam. They are unbreakable and flexible. For 2½ h.p. Dougs. Racing, 2/- per pair; touring, 1/6 per pair. Do not compare these with the cheap springs that are flooding the market.

SUPER STUDDED TYRES.

I have only a few 26x2½x2½ Heavy Passenger S.F. Covers left. They were bought of a manufacturer who is now fitting larger covers. To clear, 45/- and 47/6 each, fully guaranteed. A.W. says: "The finest tyre I have ever had." Tubes, 7/6 and 7/9 each. These prices are 20/- less than list. So don't miss this opportunity.

PLUG PROTECTORS.

I have now full stocks of this wonderful fitting. No more oiling up, no more burning out of plug points. Beautifully turned, with deep bins. 4/- each. Worth 10/6.

ZOOM! ZOOM!

The wonderful exhaust system which adds fire to the appearance of any 2½ h.p. Douglas. Beautifully made, finished in burnished copper. The usual silencer costs 37/6, yet my price for this system is only 30/-, and would have cost 50/- a few weeks back. The only exhaust that does not offend the ear.

BLACK INFLATORS.

Substantially made. Fits Douglas clips. Only 50 left. Usual price, 8/6. Money back if not satisfied. Clearance line. Latest Douglas Instruction Books, 1/6. Nickel Steel Exhaust and Inlet Valves for 2½ h.p. Douglas, 3/-; ditto, for 4 h.p. Douglas, 4/-. These valves were specially made for me, and mild steel, of which most cheap valves are made, do not compare with these for strength and wear.

FREE! FREE!

I have a grand line of Air-cooled Plugs for hot-stuff engines or racing machines. They make a touring bus "hang on" on long hills. To every purchaser of goods to the value of 1/- or over I will include one of these plugs free. This is not a catch, and the plug sells to-day at 8/- but I bought these cheap for the benefit of my customers.

Service Depot for the West of England. E.I.C.—Any part of any model E.I.C. in stock.

Repairs receive immediate attention.

DOUGLAS 1922 MODELS

in stock. Specially tuned shop-soiled 3½ h.p. Sports Model. Gold medal winner. £120. A real snip. Any Douglas Spares by return. Any Douglas Repairs in a few days.

THE MOTOR CYCLE Insurance Policy

Testimony

THIS space will be oc-
cupied each week with
copies of letters from
Policy holders who have
made claims. Original
letters may be inspected.

Dear Sirs,

I have to inform you that
I have now taken delivery of
my motor cycle and sidecar
... and I feel I cannot
thank you enough for your
generous behaviour to me....
I assure you that as long as you
continue to accept my annual
premium I shall never insure
elsewhere.

Yours faithfully,

**The only Safe Test
of Insurance is
Claims. We settle
Claims promptly.**

Accountancy Training pays

There is, in most large business concerns, one man who directs and controls the finances—*The Accountant*. He occupies a responsible, highly-paid position. He is right at the top . . . and his specialised training has put him there.

It is within the power of any man of average ability—working in his leisure hours—to carve out for himself a similar position. The necessary training can be acquired by means of the comprehensive Postal Courses provided by Wolsey Hall, Oxford.

Written and personally conducted by a staff of 52 Chartered and Incorporated Accountants, Barristers, and Honours Graduates, these Courses cover the Examination requirements of the various Accountancy Societies.

Why not write to-day for the Wolsey Hall

Free Guide

and Specimen Lesson? You owe it to yourself to investigate the many possibilities of Accountancy as a career. Address the

Armstrong and Sturmer-Archer

— GEARS —
REPAIRED IMMEDIATELY

We make a speciality of: **prompt and efficient REPAIRS**, and **GUARANTEE** that when a Gear leaves our works it is in perfect order, so, if in trouble with your Gear, it is to your own interest to send it direct to us. This is the most satisfactory method and quickest, for we submit quotation same day, and repair immediately on receipt of instructions. If quotation not accepted, no charge.

REMEMBER, We undertake to repair your gear while you or your messenger waits.

WHEN SENDING REPAIRS:

1. It is advisable to send complete wheel.

2. A letter advising as to date despatch, station sent from, and mark and number of hub should be posted, and, **MOST IMPORTANT**, two labels bearing sender's name and address on reverse of both should be tied to the wheel.

Station for Callers—Heston-Hounslow, District Rly.

Passenger Motor Cycles.

THE most popular passenger vehicle on the road—the ubiquitous sidecar—promises to be even more popular than ever it has been. This is, of course, a natural tendency, since economy is to-day the keynote in every sphere of our national life. In this issue are described most of the new models which will be offered to the public in 1922, and which will be exhibited at Olympia from the 28th of this month until the 3rd of December.

Questions of comfort have exercised the minds of all responsible for passenger machines this year; the main feature of the car show was the exceptional amount of detail work designed to enhance the quality of comfort. At the Paris Salon the same tendencies were in evidence.

Closer attention has been given to springing, and most designs now reveal that the sidecar is no longer regarded as a wheel, a frame, and a body, so that the margin between the least and most efficient types has been considerably narrowed. Quality has improved—and at the same time prices have been reduced, so that the same price gap as existed between sidecars and light cars two years ago is still maintained.

Improvements in engines and transmissions are also noticeable, but on the whole there are less entirely new models than usual; rather have the makers attempted, by more economical production methods, to reduce prices to figures such that the purchaser can no longer hesitate on the score that further reductions may be expected.

Taken altogether, it is quite apparent that 1922 prices are being based entirely upon production costs, and that the latter are more stable than they have been since the Armistice.

There is no doubt that there will be keen competition in public favour, and this is a good sign from the buyer's point of view, for while demand exceeded the supply there was no incentive for manufacturers to consider seriously such questions as cost and improvement. Now, as with every

other industry, it is a case of the survival of the fittest, and we can say with confidence that most of the new designs we have inspected are worthy to survive and to uphold the traditions of British workmanship and design.

Price Reductions.

SUFFICIENT is now known of the manufacturers' programmes for 1922 to enable us to state that next year prices will be considerably reduced.

Prices for the year 1922, compared with those prevailing at the commencement of the current year, promise to show an all-round reduction of about 25%, and this, in conjunction with the considerably reduced costs of tyres, petrol, oil, and other items concerning running costs, should assist materially in greatly increasing the number of motor cyclists. Those motor cyclists who have watched the fall in car prices do not always realise that approximately proportionate reductions have been made in the prices of motor cycles.

By careful reorganisation and improved methods of production some remarkably low-priced machines may be seen at Olympia at the end of this month. When the value of the pound is compared with its pre-war standard, and considered in conjunction with 1922 prices of motor cycles, it will be appreciated that never has the British motor cycle offered such good value. Refinements have been added and important points greatly improved. Had these been incorporated in 1914 designs with a consequent increase in cost, they would have emphasised even more the present day value.

Manufacturers realise that at the present time motor cyclists are very discriminating, and that their only hope of a successful year in 1922 depends entirely upon their offering the best possible workmanship, material, and design at the lowest possible price; therefore the prices which will be quoted at Olympia should stand firm for some time to come.

OCCASIONAL COMMENTS

By 'IXION'

CHEDDAR

Looking Backwards.

AS I mentally contemplate the passenger exhibits at Olympia, my reverie flits back across the years to the time when I also was an impecunious youngster, whose prime interest in life was the other sex. The sidecar and the cycle car were still unborn. I had a motor bicycle of the type which may start to-day, and may not have started by to-morrow. It had an engine which liked hills about as much as a sailor likes bombs. It had a belt which slipped more in dry weather than the worst modern belt slips in a watersplash. It had a contact breaker about as substantial as the icing on a wedding cake. Its brakes—I still sweat at the remembrance of them. The front brake was called a “spoon,” and consisted of a large pad of rubber in a steel shoe, which was depressed on to the tread of the front tyre by a steel lever some 2ft. 6in. long, resembling a Turkish scimitar. The back brake was a Bowden horseshoe. The Bowden people used to assure me that their 1902 cables were guaranteed to stand 2,000 tons per square inch, and that my troubles were wholly ascribable to improper fitting. It may have been so. But if the wire did not snap incontinently when I put the brake on, the brake shoes would drip out of the horseshoe; or one pull-off spring, precariously anchored to a wafer clip round the frame tube, would be missing; the surviving spring would then haul the horseshoe

lobsided. When I braked, a noise like an urchin rubbing a stick along iron palings would form a horrid prelude to the sudden collapse of my back wheel, as all the spokes fell into the road.

And the Trailers —!

LATER on some earnest firm—probably Mills and Fulford—constructed substantial trailers which would genuinely stand the bucketing which motor cycle haulage inflicted. But at the era of which I write, our trailers were built for pedal cycles (Yah! I remember that time). That is to say, their tubes were as thin as a Gillette blade. Their favourite point of fracture was just behind the connection to the bicycle seat pillar. The trailer then up-ended itself backwards. Out went Araminta. These trailers were really rather convenient for youthful motor cyclists at the susceptible age. No-gentleman likes telling Araminta that Mabel has succeeded her in his affections. There is usually a scene, and, being in the wrong, one feels sheepish. But if the trailer tube snapped, it was Araminta who started the *strafe*. And one didn't feel to blame. Moreover, if one didn't happen to desire a breach, it gave one an excuse for being very tender and affectionate whilst comforting the stricken Araminta, so that relations were usually advanced one stage. Of course, for married men the trailer was the deuce and all. Breakfast the morning after—it must have been *fearful*.

But Nowadays —.

SO I try to picture myself going to the 1922 Olympia as an irresponsible flirt of, say, nineteen summers, with an *Ollà Podrida* of all the Gibson and Kirschner girls at the back of my mind, and hesitating between a cycle car and a sidecar. Of course, the flapper bracket is well enough for the forthcoming type of damsel, but I always liked the shy sort best. Possibly such damozels would regard the very close company of a cycle car as rather alarming in the first chapter of the acquaintance. The comparative isolation of a sidecar, especially with a hood and an Easting, would, I think, have appealed to the sort of maiden who once charmed me. For conjugal couples, too, the sidecar has distinct attractions. If she begins to nag, one can open the cut-out, and, really, conversation becomes almost impossible.

Occasional Comments.—

The A.V.

I HAVE often prophesied that the cycle car would ultimately join issue with the sidecar, but I cannot say that I ever expected to see the offensive begun in 1922. Still, the A.V. is a real eye-opener in that line. Here we have an 8 h.p. two-seater with a very good "performance," and freed from that extreme narrowness of track which handicaps some cycle cars for use on really bad roads. Moreover, by averaging nearly a mile a minute in the 200 Miles, it showed that it is staunch, as well as taking to the eye. No doubt Major Empson split-pinned and spring-washed and taped everything he could think of; but there is nothing to prevent any other user from doing the same. Indeed, most hard riders tackle their new machines in the same jaundiced and cynical spirit. The A.V. works are not of Ford dimensions, and possibly a gigantic cycle car factory could go one better if its No. 8 hats did not all take £1,000 a year.

The Lightweight Sidecar?

THE lightweight sidecar is the logical corollary of the light car. A few years ago, when metallurgy was crude, and air-cooling took the form of never asking an engine to develop more than half its rated horse-power, we dared not set an engine to rev. perpetually. Knowledge grew. It became possible to ask an engine with a maximum output of 15 h.p. to develop an average of 10 h.p. during its working life. Hence the light car. Similarly in the motor cycle world we can now set a 2¾ h.p. engine to give off almost its full power continuously; and it will neither scale its exhaust valves, seize its piston, nor melt its plain bearings (if any). We are not all F. C. Norths, and every route is not as dead easy as the 1921 Six Days course. But the impecunious

owner, resident anywhere short of the Alps, has at least two choices. He may perch his girl on a flapper bracket. Or he may seat her comfortably in a bijou sidecar, harnessed to what would only be a potterbus if it were ridden solo.

Compassionately.

WHILST I am on passenger topics I would draw the attention of designers, manufacturers, and victims to one of the most pathetic spectacles which our roads afford. My withers are sadly wrung when I pass an elderly female on a push-trike (I take it there is no odium in this compound?), and I hear a malevolent sniff of hate, disgust, and pity as I flit swiftly on. But my withers (what are "withers"?) are wrung still more when I overtake an elderly 500 c.c. combination travelling slowly. The bent, middle-aged driver is going slowly, not because he could not go faster, not because he does not like speed, but because he knows his outfit will fall in half before long if he opens the throttle. His rigid, unsprung outfit is bumping dizzily over the pot-holes on very narrow tyres, and if you gauge alignment with a swift glance from any angle, you will see that both his cycle frame and sidecar chassis have long since whipped out of truth. He and his lady utilise this meagre and uncomfortable transport because it is the only private transport which they can afford. By contrast you will occasionally see a 500 c.c. outfit of more recent date, designed by a man with soft tissues and deep sympathies. It has flabby gin. tyres, a howling good fork, and a spring-mounted saddle. I have written much and often on the acute discomforts of some solo machines. But these solo 'buses are air-cushions compared to an ungenerously conceived sidecar outfit of the cheaper sort. Big tyres and plenty of springing are two slogans which sidecar buyers will bear in mind for 1922, and until our roads grow better.

IN THE TEA PLANTATIONS.

The motor cycle is becoming increasingly popular in Ceylon, where there are really excellent roads. The scenery, too, is magnificent, fine wooded valleys and mountain ranges being a feature of this beautiful island.

BY ROAD TO THE SHOW.

Some Hints to Provincial Motor Cyclists on How to Find Olympia.

AS a general trade reunion, it follows that the contingent of Show visitors from the Midlands is a large one.

Quite a number of motor cyclists are in the habit of journeying up from the Warwickshire and Staffordshire homes of the trade by road, and, no doubt, more would follow this example but for a mistaken idea of the complexity of London traffic and the difficulty of finding Olympia in the largest city in the world.

Although thousands have visited London for the Shows, it is astonishing to find the number who would be hopelessly lost if landed at the railway terminus

and there were no courteous policemen to advise them regarding the right 'bus or tube to take.

Usually, those who journey by the L. and N.W. trains change at Willesden on to a local train for Addison Road, which deposits them alongside the main entrance to Olympia, but many of these visitors have not the slightest idea into which part of London they have been deposited, and, when an evening trip into the West End is suggested, they almost invariably turn to the right (toward Hammersmith Broadway) on reaching the Hammersmith Road, instead of to the left.

Midlanders making the trip by road can travel by alternate routes:

(1.) Birmingham, Coventry, Daventry, Dunstable, St. Albans turn right to Edgware.

(2.) Via Oxford, Henley, Staines, Brentford.

(3.) Via High Wycombe and Uxbridge.

The first route brings the rider directly to the Marble Arch, where he may either turn sharp right, and follow the traffic to Shepherd's Bush Exhibition ground, then left along Holland Road to Hammersmith Road, with Olympia a few hundred yards to the right. Or he can cross the main thoroughfare, down Park Lane to Hyde Park Corner, turn right along Knightsbridge and straight ahead to Olympia.

The alternative routes approach Olympia from the west, and nothing disconcerting will be experienced unless it be Hammersmith Broadway (when route 2 is taken), where the stranger may be uncertain which of the many streets he must take. In this case, let him make as straight a crossing of the tangle as possible, and then look out for the Clarendon Restaurant on his right, which will indicate that he is in the Hammersmith Road, less than a mile along which is Olympia on the left.

The third route brings the rider to Shepherd's Bush, where a right turn along Holland Road should be taken.

"Addison Road" entrance to Olympia. Vehicular traffic approaches it from Hammersmith Road.

The Sidecar Reigns Supreme—even over the Railway—as an Inexpensive Means of Transport, not only for Two, but for Whole Families.

JUST as it is supposed that it is every motorist's ambition to possess a Rolls-Royce, many motor cyclists who own the *de luxe* type of outfit consider that every other type is but a step towards the top.

Probably members of *The Motor Cycle* staff have had as varied experience with different types of sidecars as any similar number of enthusiasts, yet it is their unanimous opinion that there is no pinnacle upon the crown of which rests one machine or even one type.

Anticipatory pride of ownership is an ever-varying trait inherent with all motor cyclists, and it is strange that almost everyone's dream mount is different and usually of a type with which no actual experience has been obtained. When the ideal of yesterday materialises to-day, the dream changes, for anticipation is always more enjoyable than realisation. Thus, almost every motor cyclist thinks continually of his next new mount, but the illusory quality which is sought for is not always increased power; it is not always increased efficiency; nor greater refinement. Ask a hundred motor cyclists to specify their ideals and there would be at least fifty different answers; but they would all spell two words — something new.

So we may regard every single sidecar machine to be seen at Olympia as somebody's ideal; but what of those who have no ideals or knowledge of the capabilities of the different types?

Obviously the heavyweight couple with two plump children are not promised the utmost satisfaction with a miniature machine of under 350 c.c. capacity, and the average dual purpose mount may fall short of the expectations of the young man who anticipates sidecar speeds to equal those of Temple or Le Vack.

Let it be said that the speeds so glibly mentioned by stand attendants are not always a safe guide as to a machine's capabilities. In these days when solo machines are capable of over 100 m.p.h., to mention a mere "fifty" may seem to do a mount scant justice, but a sidecar capable of 45 m.p.h. may be regarded as really fast, and, in due respect to all fast road men, let us whisper that very few sidecar machines

Every sidecar machine which will be seen at the Olympia Motor Cycle Show may be regarded as somebody's ideal.

The speeds maintained at Brooklands at the conclusion of the Six Days Trials may be accepted as what may reasonably be expected from similar machines in the hands of private owners.

sold to the public are capable of attaining, let alone maintaining, 50 m.p.h., however favourable the conditions may be. Only two sidecars exceeded 45 m.p.h. in the twenty-five lap speed test at Brooklands after the last Six Days Trials. One of these was an 8 h.p. Matchless and the other a 6 h.p. B.S.A. Both were light sidecars.

Economical Motoring for Two.

The schedule published in our issue for September 15th, which gave the speeds of all the survivors in the Six Days Trials, may be regarded as a very fair guide as to what the average privately-owned sidecar outfit may be expected to accomplish for short distances, and, in view of the exaggeration of owners and salesmen alike, it would be well, perhaps, to remark that the speeds, which are given below, may be accepted as very good indeed.

There are, however, many sidecar owners who will disagree with this statement, but let them find a five mile stretch of deserted road, without crossroads and traffic, and traverse it early some morning in order to see for themselves that it is one thing to

STRIKING PERFORMANCES BY SMALL TWO-STROKE SIDECARS IN SIX DAYS TRIALS.

Above is seen W. Peatty on the Hawker, climbing Scotland's most severe hill, the six-mile-long Applecross. On the left: F. C. North ascending the once dreaded Porlock on his O.K. sidecar. Both these hills, not long ago, tried severely even powerful mounts.

get the speedometer needle up to 40 m.p.h., and quite another matter to cover four miles in six minutes. When this is realised, it will be appreciated that a maximum speed of 40 m.p.h. is as much as ninety per cent. of sidecarists require. After all, there is a speed limit of 20 m.p.h. in this country, and, even if there were not, there are very few places where sidecar speeds higher than 40 m.p.h. may be indulged in safely.

Speed, however, is not the chief consideration of the average buyer. Comfort comes first, and, taken generally, the larger the machine, the greater is the comfort, but even this point depends largely upon the design of the sidecar body, and there are "sporting" sidecar outfits of 8 h.p. which do not give to the passenger the same comfort as a lightweight fitted with a small tourist sidecar.

Sidecar discomfort may come under two headings: (1) the body may be cramped or the angles of the cushions may produce an unnatural position, and (2) the springing may be at fault.

The average speeds for sixty-eight miles on Brooklands of different types of passenger machines at the end of the last "Six Days," and referred to above, were as follows:

Two-stroke engines of quite small capacity may now be regarded as capable of serious sidecar work.

		M.P.H.
3½ h.p.	P. and M.	34.92
4½ h.p.	Dunelt	31.52
6 h.p.	Martinsyde	40.94
8 h.p.	Matchless	46.95
5-6 h.p.	Rover	38.12
4 h.p.	Norton	43.95
6 h.p.	Ariel	38.61
7 h.p.	James	43.21
7 h.p.	A.J.S.	43.64
6 h.p.	B.S.A.	45.63
8 h.p.	Sunbeam	40.94
8 h.p.	Morgan	44.03
8 h.p.	T.B.	42.24

VARIOUS TYPES OF SIDECAR MACHINES DISCUSSED.

THE SMALL TWO-STROKE OUTFIT.

One of the most outstanding developments of the past few years has been the improvement of the two-stroke to a stage that quite a small engine may now be regarded as a serious proposition for sidecar work.

Before the war, a few adventurous spirits attached light sidecars to solo lightweights and obtained a certain amount of good service in pottering about flat districts. But this was sometimes at the expense of distorted frames and undue wear of engine and wheel bearings.

This practice, however, was discouraged as being distinctly unfair to the makers and not without danger to the driver, for a lightweight designed for solo work is not at all suitable for hauling a sidecar, and this should be remembered by the present-day owner of a two-stroke, who, seeing that the makers of his machine sell a small sidecar outfit fitted with the same engine as his own solo mount, may be tempted to convert it into a passenger outfit. In all probability the frame, forks, wheel bearings, size of tyres, and the gear ratios are totally unsuitable for the double load.

When a maker offers a miniature sidecar outfit to the public, it may be taken for granted that the frame has been strengthened, the wheel bearings enlarged, and the machine generally designed for the work it is intended to do.

No Longer a Toy.

Old motor cyclists who have traversed the highway of experience with all the older types of machines are apt to regard the little two-stroke outfit as a toy. One member of *The Motor Cycle* staff shared this view until, early this year, he saw a little Velocette haul a sidecar up a trials hill which had brought him to a standstill on a machine with a much larger engine. Then the wonderful ascents of Porlock and Lynton of F. C. North (O.K. sc.) in the A.C.U. Trials, and the manner in which the little Hawker climbed Applecross in the Scottish Trials, caused a number of riders to amend their views.

To many Porlock, Lynton, and Applecross are but names, but there are riders to whom each name spells

defeat in pre-war battles with gradients. In 1914 it was regarded as cruelty to machinery to endeavour to climb such hills with a $3\frac{1}{2}$ h.p. sidecar, and in justice to this type—and also the modern miniatures—it should be added that the old " $3\frac{1}{2}$ " climbed every hill in the 1914 Scottish Six Days, excepting Applecross. There were three similar machines in that trial—a Sunbeam, a Premier, and an Ariel—and they all "petered out" on Applecross within a few yards of each other, which seems to be proof that this hill marked the limit for that type. Yet in the year 1921, a two-stroke of under 350 c.c. capacity took a sidecar up to the summit!

So much for the power of the little two-stroke sidecar—now for actual experience under ordinary private owner conditions.

Miniature Sidecars on the Road.

After using one of the heaviest sidecar outfits on the road, the Ivy first impressed us by its lightness. We re-discovered how easy it is to lift the wheel of an empty sidecar on left corners, but, after re-adjusting driving methods to meet the new requirements, one quickly becomes accustomed to the feel of the machine.

On the road, with a passenger in the sidecar, speeds up to 32 m.p.h. were possible, but, owing to the light weight, scarcely advisable; though at 20 m.p.h. or a little over, the machine was really delightful to handle. However, average speeds of 20 m.p.h. are comparatively easy to attain, and, for all the extra power of larger machines owned by the writer, averages of 20 m.p.h. have been but rarely exceeded on short journeys. After all, it is "good going" to do an eighty mile journey in four hours, and there is little pleasure for the passenger in going all out for miles on end.

The Connaught and the O.K. gave similar service at ordinary touring speeds—there was always ample power in reserve for inclines, and gear-changing at corners was not called for even so much as it is in the case of big single outfits. This, of course, is due to the even firing torque of the two-stroke, which gives the same impulse effect as a flat twin four-

Although these small sidecars are not capable of very high speeds, averages of 20 m.p.h. are comparatively easy to attain.

Two Blackburne-engined outfits equipped for all-weather service. (Left) The $2\frac{1}{2}$ h.p. Verus and (right) the 8 h.p. Rex-Acræ.

Economical Motoring for Two.

stroke—and no doubt the fact that most two-strokes are comparatively low-compression engines has something to do with this attribute.

Another member of *The Motor Cycle* staff took a Connaught outfit on tour; with his wife as passenger and with luggage, nearly 20 m.p.h. was averaged over the whole of the 380

The chain-driven "big single" is a go-anywhere sidecar. The driver of the Norton is quite happy negotiating a ford, while the new Rex-Acme single proves its hill-climbing ability by making a clean ascent of Screw Road, the Welsh hill discovered by *The Motor Cycle*.

and to lie, rather than to sit, in the body are in the minority. Both the Ivy and the O.K. sidecars have doors and lockers, and a hood and a screen could easily be

miles covered—and this with a petrol consumption of 90 m.p.g., and a total load of 700 lb.

All the three machines mentioned (O.K., Ivy, and Connaught) have extremely smooth running engines, and, once under way, the torque reminds one of a four-cylinder engine.

We have also heard very good reports of the Calthorpe and Francis-Barnett lightweight sidecar outfits, while one must also give credit to the makers of the Ixion, who, we believe, were the first firm to market an outfit of this character specially designed for the work. We recall quite an enjoyable run in one of this firm's pre-war outfits fitted with a three-speed hub gear, and, amongst others, we had good service from a Beardmore-Precision spring frame outfit of 350 c.c. capacity.

At the Olympia Show, no doubt, we shall see quite a number of these two-stroke lightweights, fitted with sidecars, and, in the majority of cases, we think it will be found that the makers have realised that a light sidecar can be produced without sacrificing the comfort of the passenger. The Ivy and O.K. firms, to mention two, have realised that those who prefer to climb over the side

added if desired. The same thing applies to several other 1922 editions of this type.

THE SMALL FOUR-STROKE TYPE.

For several reasons, which need not be discussed here, the very small four-stroke engine is not so suitable for sidecar work as a two-stroke of the same cubical capacity. From personal experience, we judge the two-stroke of 250 c.c. infinitely superior for passenger work to a four-stroke of this size. Add another 100 c.c. to the capacity, however, and the position is very much different.

For the coming year, quite a number of sidecar machines will be marketed fitted with this larger type of lightweight engine. Among these may be mentioned the A.J.S., which, with side-by-side valve engine in place of the famous "2 $\frac{3}{4}$ ", with which both the Junior and Senior T.T. were won, has already been found to make a successful sidecar machine. Other machines of the same type, and which will be at Olympia subsequent to their success during 1921, are the Royal Ruby and the Verus-Blackburne, the "slogging" power of the latter engine being specially suitable for heavy loads.

The 350 c.c. four-stroke machine is a dual purpose mount in every sense of the term.

Economical Motoring for Two.

The writer has had in use for most of the past summer one of the last-mentioned mounts, fitted with a sporting Canoelet sidecar, and the conclusion has been formed that, as a genuine dual-purpose machine, it is nearer the mark than any type of motor cycle which is claimed to be designed for the double purpose of solo riding and towing a sidecar.

Defining "Dual-purpose."

The term "dual-purpose" has two almost different definitions; the manufacturers usually apply it to machines which are suitable for both the soloist and the family man; that is to say these machines—usually of the $3\frac{1}{2}$ and 4 h.p. variety—are intended to appeal to two distinct markets, but are not seriously regarded as ideal for the man who requires a sidecar machine which may be quickly separated in order to use it as a solo mount. On the other hand, to the average owner a dual-purpose mount is one which he may use for either purpose at will. Usually, the purchaser of such a mount requires it chiefly for solo riding, but has occasionally need for a sidecar which does not necessitate calling in the assistance of his neighbours to attach or detach.

The little Verus fulfils these requirements. It is a solo machine, first and a capable little sidecar outfit when required. The sidecar is light enough to detach single-handed, so it really does come off when not required. Some years ago, we ran a 500 c.c. machine, purchased with the intention of using it with a sidecar occasionally. Altogether 7,000 miles were covered: 1,000 solo, 5,000 with empty sidecar, and 1,000 with sidecar and passenger. The figures speak for themselves.

We thought the same thing would happen when we took over the Verus, but it came apart so easily, and there was no difficulty in getting it back again; that, after the first few rides with an empty sidecar, the attachment was always left at home when the passenger was not to be taken, for a light and empty sidecar is not really a joy to drive when affixed to a fast machine—and the $2\frac{3}{4}$ h.p. Verus is quite fast enough to make sudden swerves fairly exciting.

Light Motoring for Two.

For light motoring for two, this type of machine has many advantages. First, the tax is only £2 10s. instead of £4; second, the fuel bill is considerably lower than larger machines; in fact, half that of the average big twin outfit. It is light enough to be regarded as a lightweight, and

A modern 4 h.p. motor cycle gives a buyer ample scope in the type of sidecar he may use.

fast enough to go touring in any company, for the 350 c.c. machine is now capable of averages which are as high as our roads allow, so that with any amount of extra power it is usually difficult to travel much faster.

For a lightweight couple, married or in the contemplating stage; for the youth and his sister—or somebody else's sister; for boys or girls, the Verus-Blackburne or some such outfit is ideal, and, unless *pater familias* is a reckless old gentleman, the youngsters will be able to keep him in sight on his heavier A.J.S., Excelsior, or Ariel, which fact illustrates that it only requires $2\frac{3}{4}$ h.p. to propel two people. The other $5\frac{1}{4}$ h.p. is only needed to take care of the (1) extra weight of the machine, (2) the extra weight of the sidecar and its equipment.

THE BIG SINGLES.

So far we have discussed only machines which may be termed light tourist models and intended for two persons. When a buyer invests in a modern 4 h.p. motor cycle, he has a far greater scope in the type of sidecar he may use, the number of passengers he may carry, and comfort providing equipment such as screens, hoods, pillion seats, and luggage grids.

This type of engine for sidecar work will always be popular for several reasons. First, it is the most economical engine for the family man, and it is simple, although not so simple as the two-stroke. We are not now referring to the father of a large family. Motor cyclists with more than two children must have

a big sidecar and a big engine to pull it, and, when the family party exceeds six, *pater familias* must either arrange to split up parties or secure a Ford car fitted with a char-à-banc body.

Now the fastest sidecar machine the writer has run for any length of time was a Stanley-tuned Triumph. It was one of the first of the chain-driven models, lent for a three months' test under private owner conditions before it was placed on the market. This machine, fitted with a somewhat heavy Gloria sidecar, an Easting screen, and usually carrying an adult and a boy of nine, covered over 3,000 miles. The consumption averaged over 83 m.p.g. of benzole, and it ran 2,000 miles before being decarbonised. The fastest run was 100 miles in

The Dunett proved the possibilities of the big single two-stroke in the 1920 and 1921 A.C.U. Trials. It is seen ascending the notorious Lynton Hill.

EXTREMES IN 8 H.P. SIDECARS. (Above) The sporting type popular among competition riders. (Inset) A Vindex three-seater sidecar with pressed steel chassis.

four hours over indifferent roads. During these three months the tool roll was opened but once—to repair a broken rear chain which had been allowed to run too slack. Only once did we have to give way to a faster machine other than American twins, and that was a Norton driven by its designer—one of the “hardest” sidecar drivers we know. But no better tribute to the success of the single-cylinder sidecar is to be found than the numbers in use. Any observant motorist must have noticed the large number of B.S.A. outfits on the road.

Probably this type of machine is not quite so economical on tyres as a good twin. This does not apply only to chain-driven mounts, for the average chain-cum-belt motor cycle is as harsh in its transmission as all-chain, so much so in fact that the Triumph Co. now equip their chain-cum-belt model with a shock absorber.

In this respect the Sunbeam is particularly smooth running, and this, in conjunction with the “little oil bath” and the clutch, renders it extremely pleasant at low speeds—usually not the single’s strongest point.

In the days of efficient clutches and gear boxes, however, there is no reason why a driver should not change into second gear for slow running in traffic and at corners.

The Big Single Two-stroke.

The big single two-stroke is another type of motor cycle which will interest the prospective purchaser of a medium-powered machine. In this class the Dunelt

is the best known; in fact, the only one made in any quantities, and one member of our staff, who has owned one for the past year, has found it eminently satisfactory. In its road performance it resembles a 5-6 h.p. twin, and, as it possesses the slow-pulling qualities of all two-strokes, it may be regarded as a top gear machine, in that it is not necessary to change down so much in traffic, or corners, or on hills, for the Dunelt pulls well on a hill almost to a crawl, when the majority of four-stroke singles would knock and “konk out.”

The 500 c.c. four-stroke is on the small side for this class of mount, and an extra fifty or so cubic centimetres makes a great deal of difference. In this connection, it is interesting to know that all firms who have been successful with single-cylinder sidecar outfits have now increased the size of the engine; even the P. and M., staunch adherent of the 500 c.c. class, has at last grown into the 4½ h.p. category. The 3½ h.p. Ariel has a long list of successes to its credit—a 4½ h.p. model was added to the range at the last Olympia Show. The Triumph “4” (550 c.c.) was originally a “3½”; the 500 c.c. single-cylinder J.A.P. was well-known before the war; for 1922, many well-known machines will be fitted with the new 550 c.c. engine of this make.

A new Blackburne of 550 c.c. has been added to the well-known outside flywheel group, and the Sunbeam range is now increased by the introduction of a new 4¼ h.p. model, which we have driven and found excellent. In addition, there is the well-known Norton Big Four, the 4½ h.p. Excelsior, the 4½ h.p. New Hudson, and the Quadrant.

It has become the accepted rule to regard the twin engine as an essential for the “de luxe” type of outfit.

Economical Motoring for Two.—

THE TWIN-CYLINDER SIDECAR.

The chief advantage of the twin-cylinder engine for sidecar work is its smoothness in running, due to the increased number of impulses as compared with the single-cylinder.

Although a few years ago single-cylinder engines were made as large as 800 c.c. capacity, the largest singles now on the market do not exceed 700 c.c., and it has become the accepted rule to regard the twin engine as an essential for a *de luxe* type of outfit.

Undoubtedly the twin engine is quieter than the single, and this, coupled with its other advantages, will lead the novice to wonder why all motor cycles are not fitted with engines having two cylinders or more. One of the reasons is that the advantages are not secured without some slight loss, and it is now accepted as fact that two cylinders do not produce the same power as one cylinder of the same capacity as the total of the two. Thus a twin engine with cylinders of 250 c.c. each (total 500 c.c.) is not expected to produce the same power as a 500 c.c. single-cylinder. Certain special racing engines of the latter type are known to have developed 20 h.p., yet no twin engine fitted with two cylinders each of 500 c.c. capacity has been known to produce 40 h.p. One of the reasons for this is the extra friction of working parts. Another reason why small twins are not so popular as singles is the smallness of the working parts.

Excepting in flat twins, no two-cylinder engines are now made under 500 c.c., and very few of these are available and not recommended for sidecar work, although 500 c.c. Lea-Francis, James, and N.U.T. solo mounts are used with a certain degree of satisfaction with sidecars.

Twin-cylinder machines offered to the public with sidecars begin with the 530 c.c. Scott, but this machine, being a two-stroke, is in a class by itself, and has the same impulse effect as a four-cylinder engine. Among four stroke V twins, those engines with 5-6 h.p. J.A.P.

power units may be regarded as "go anywhere sidecar machines," but to be able fully to appreciate the liveliness of this engine, the owner should not fit a sidecar of the heaviest type. In other words, these 5-6 h.p. machines, such as the Rover and others fitted with 5-6 h.p. J.A.P. engines, make fast sporting outfits if not overloaded, but for heavy family work, an 8 h.p. engine is desirable, although not strictly necessary. So much depends upon requirements that it is difficult to lay down definite rules.

Among those machines fitted with engines manufactured by the makers of the cycle, the twin B.S.A. deserves consideration, while the 7 h.p. A.J.S. also is acknowledged to be among the best outfits on the market. This latter machine has an engine of about 800 c.c., and the little extra power produced by another 100 c.c. of the Ariel 6-7 h.p. and Abingdon engines places these three mounts in a category between the "five-sixes" and the 1,000 c.c. "eights," such as the Matchless, M.A.G., the Jap-engined Excelsior and Sunbeam, the Enfield, and the Rex, not to mention the American big twins—the Indian and Harley-Davidson.

Another type of twin machine which is eminently suitable for mediumweight sidecar work is the flat twin represented by the silent 4½ h.p. Humber and 4 h.p. Douglas. A little larger model of the Douglas will also be marketed in 1922—an overhead valve machine which it is claimed will do 60 m.p.h. with sidecar. In this class, so far as size is concerned, is the 5-7 h.p. Coventry Victor.

The writer has owned an 8 h.p. Blackburne-engined Rex for the past two years, during which time it has been in use with a family sidecar having a dickey seat.

Readers contemplating the purchase of such a machine may be interested to learn that, with a Binks carburetter, the average petrol consumption is 50 m.p.g., although 60 m.p.g. has been obtained on long runs at speed. The original 28 x 3 in. Dunlop tyres were untouched for 10,000 miles; at the end of that distance the front tyre was retreaded.

Another type of two-cylinder engine eminently suitable for a mediumweight sidecar is the flat twin.

Flat twin sidecars have proved their worth in classic trials. One of the outstanding performances in the 1920 A.C.U. Six Days was the 4½ h.p. Humber's clean ascent of Park Rash.

MODERN THREE-WHEELERS.

A Review of all Types Offered as a Step
between Sidecar and Small Car.

EVER since the introduction of the three-wheeler, the type has been of absorbing interest to certain manufacturers and to a large section of the public. It would appear to be the obvious intermediate stage between the sidecar outfit and the car; for, while it provides protection for both driver and passenger, it can be made lighter and simpler than any conventional four-wheeler.

As in all forms of engineering, difficulties have cropped up; but our manufacturers have steadily overcome these troubles by careful road test and experimental work. It is not an easy matter, for instance, to provide flexible front springs, and yet prevent rolling of the rear wheel; and in the early days it was not uncommon for three-wheelers to turn turtle when driven fast round sharp bends. Nevertheless, the problem has been solved; for, in spite of the fact that suspension nowadays is better than of yore, an overturned three-wheeler is as uncommon as a car in a similar predicament.

Simplicity or—

Opinions on the correct form for three-wheelers are still widely divided; and, though there are less than a dozen well-known manufacturers at the present moment, there are four distinct types of machine, with one or two sub-divisions. First, there is the ever-popular Morgan, which, especially in its simpler forms, approaches very nearly to the ideal layout. It is light, cheap to buy, economical in use, and

almost the last word in simplicity. The high power-weight ratio renders the simple two-speed gear ample for all normal work, and the comfort and protection provided for the driver are equal to that of many light cars. Though luxurious water-cooled Morgans are supplied to those who require them, they still

Probably the most popular runabout on the road—the Morgan three-wheeler, a make that has proved itself time and again in trials and speed events.

retain the main characteristics of the type, and remain distinct from the car on three wheels as exemplified by the New Hudson and T.B.

Luxury?

Here we find *de luxe* models with water-cooled twin engines, three speeds and reverse gear boxes, and, in the case of the T.B., final shaft drive. The bodies of these machines are deep and luxurious, and the specification is similar to that of most light cars, and, indeed, the addition of a fourth wheel would complete the metamorphosis. A third type is the Scott Sociable, which is in effect a highly developed sidecar machine. Here again we find three speeds, shaft drive, and a water-cooled two-stroke engine; but in no way, except as regards comfort and transmission, can the Scott be referred to as a car on three wheels. The most ingenious frame construction has advantages over both three and four-wheelers of normal design, and, though a little startling to the uninitiated, it is a thorough engineering job from end to end. Here again weight is reduced to a minimum, and in this design there are two

Fine finish in chassis and body work characterise the New Hudson, which is fitted with three speeds and reverse.

Modern Three-wheelers.

wheel tracks only, which is a decided help, from the springing viewpoint.

Quite distinct from the types mentioned is the Stanhope, with its front wheel drive. Front wheel drive has many advantages, and has fascinated designers of all engineering countries, the French Caffort being another example, while the Phano-mobile and certain German electrically-propelled vehicles are also driven in this manner, as are certain commercial three-wheelers.

Two varieties of the first-mentioned type must be mentioned—the L.S.D., a solidly constructed and well-sprung machine having an air-cooled engine and two speeds and reverse, and the Castle Three, fitted with a four-cylinder water-cooled engine, two speeds and reverse, and shaft drive.

It will be seen, therefore, that admirers of the three-wheeler have a choice of almost every possible type, and may decide for themselves the relative merits of air and water-cooling, reverse or no reverse, two or three tracks, two or four cylinders, chain or shaft drive, and so on. Whatever his choice, the hesitating buyer may be cheered by the fact that there are good machines of each type, and that there are few, if any, bad three-wheelers on the market at the present time.

Which is Best?

Now the reader of these notes will be apt to complain that they do not help him in his choice. Which is the best three-wheeler? Well, the question is equivalent to asking what size is a cardboard box? He must decide first of all if he requires a light simple runabout or an altogether heavier and more luxurious

The T.B. three-wheeler, which has been much improved in appearance. It has a water-cooled V twin engine, three speeds and reverse, and final shaft drive.

mount. If the former, do special circumstances require a reverse, or is he on rare occasions prepared to lift round the tail of his machine? The heavier types need a reverse, and are all fitted therewith. The Scott needs no reverse, since it is provided with a steering lock which enables it to turn with its "sidecar" wheel as a pivot.

Front wheel brake construction on the T.B. runabout.

Air or Water Cooling.

Interchangeable wheels are now almost universal, but again, does the prospective purchaser prefer water-cooling which requires less attention as regards decarbonisation and reduces the engine noise, to the altogether simpler and lighter form of air-cooling? The choice is altogether a matter of personal requirements and taste, and must be left almost entirely in the hands of the customer, price being usually the controlling factor.

There is always a market for the best possible machine in its class, but experience teaches us that super-development in the three-wheeler world is apt to lead to the growth of a fourth wheel, and so we lose a promising three-wheeler, while the car trade gains a new adherent and some more new ideas.

On the other hand, the three-wheeler is essentially a link between the motor cycle and the car, and as such it will always remain a popular type so long as manufacturers retain their sense of perspective, and take advantage of the fact that a three-wheeler of given specification can always be made at a lower price than a four-wheeler of the same specification. Add to this the fact that taxation is very much less in the case of the three-wheeler, and we have two cogent reasons for the development of these popular and handy runabouts.

The only example of its kind, a two-track three-wheeled runabout—the Scott Sociable—shown with the engine cover removed.

Modern Three-wheelers.

There are as usual rumours of newcomers to the class, and we must await still further developments, but we cannot help thinking that there is still room for more three-wheelers of the very simplest possible layout.

Unconventionality Disliked.

There is a very large number of keen motor cyclists who, as years advance, desire more protection from the elements than is provided by the saddle of a motor cycle. As regards engine and transmission, they are perfectly satisfied with that of their present-day mounts, and require only a greater degree of comfort and protection. Such machines as the Seal have gone some way to provide the necessary specification, though there is a curious but human streak in most of us which demands something that looks like a car, and for this reason, and

A well tried runabout—the L.S.D. An air-cooled J.A.P. engine, and two-speed gear with reverse is fitted.

in spite of certain mechanical disadvantages, it is probable that the simplest form of three-wheeler of the future will have three tracks instead of two, and will imitate the car in its general lines and appearance.

A four-cylinder water-cooled three-wheeler—the Castle Three—fitted with two speeds and reverse. Shaft drive throughout is adopted.

Distinctive radiator design and a tubular chassis supported in front by cantilever springs are features of the Castle Three.

Engine side of the Harper Runabout.

**A Neat Miniature Runabout.**

ing front and rear is by means of quarter-elliptic springs, and although a handle-bar is provided, the steering gear follows the practice of four-wheelers with direct steering. It will be marketed by R. H. Carlisle and Co., Ltd., of Deansgate, Manchester.

DESIGNED by Mr. R. O. Harper, of Broughton, Manchester, the little vehicle illustrated is a praiseworthy attempt to provide a convenient form of transport for shopping and general runabout purposes. Engined with a Villiers two-stroke unit, it has three speeds, and, it is claimed, is capable of climbing the well-known Cat and Fiddle on top gear. A single-lever serves the double purpose of starter and hand brake: on passing it through a gate it is disconnected from the brake mechanism and couples up with the starting gear. Spring-

COMFORT and CONVENIENCE

Items that Enhance the Pleasures of Motor Cycling for Passenger and Driver.

fitting of a hood almost invited derision. To-day, however, fully fifty per cent. of sidecar passengers demand these attributes to their comfort.

When just a flat piece of glass or celluloid was framed and hinged to the fore end of the cock pit, passengers found but one advantage; they were saved from the irritation of grit flying from the front wheel into their faces, but, as a means to prevent draught, this type of screen was a failure, as the current of air passing between the edge of the screen and the driver impinges upon the unfortunate passenger in a manner that is more unpleasant than the wind pressure present when a screen is not fitted.

A combined screen and apron of entirely new design, produced by Auster Ltd., the well-known specialists in autocar screens and hoods.

Although screens, of a sort, were in use before the war, it was not until the advent of the Easting that such protection for the passenger came into general use.

THREE METHODS OF PROTECTION.

(Left) The Vivian, Hardie and Lane side curtain.

(Top) A new screen by the makers of Montgomery sidecars.

(Right) The Bluemel screen, with adjustable wings.

Comfort and Convenience—

A leather patchwork foot-muff, by Spicers, of Leamington.

made so that the passenger may enter and leave the sidecar without first having to undo the brackets. For the benefit of newcomers to the motor cycle world, it should be added that this screen may be adjusted so that a hood is scarcely necessary.

The Cameo is another very popular screen, and has a side curtain. In the latest model the side curtain, instead of being triangular in shape and buttoned to the sidecar body, the rear edge is carried on an adjustable upright, which considerably increases the area of the curtain. The makers offer two of these curtains equipped with windows, so that for winter riding the passenger may be as snug as in a closed car.

A screen, which converts an open sidecar into a miniature saloon, is known as the Coupé windscreen. It may be used also as an apron and a roof-screen without the enclosing side curtains.

Then there is the Bluemel screen, a most refined affair with a front screen of celluloid gracefully curved at each end, and two celluloid extensions. In this case the "lights" are framed in light steel.

Two new screens for 1922 have been introduced by the makers of Montgomery sidecars and by Austers, the well-known car screen specialists, respectively. The former is a scoop-shaped screen of graceful shape and light appearance, since the celluloid is only bound at its lower edge. The new Auster contribution to the screen market is quite a novelty, and when "down" forms part of the apron, to which it is attached by a continuous lightning fastener of the kind used by quick-change artists. We have had in use for twelve

months a pair of the overalls embodying this novelty, and we can say that the fastening is rust-proof and continues to function, by means of its tab, in the same manner as it did when new.

Although screens form the

chief item in comfort equipment, there are many other accessories which considerably enhance the pleasures of winter driving. Among these, foot-warmers probably will receive due attention. There are several kinds of these now offered. They may be metal

A foot-muff for sidecars, by James Grose, Ltd.

A leather foot-muff, by Dunhills, Ltd.

A sidecar foot-warmer—an accessory appreciated by the passenger in cold weather, by Dunhills, Ltd.

Marketed by Brooks, of saddle fame, these Thermos cases are even more useful in winter than in the summer time.

The "Ideal Air Spring" pillion cushion, by Saxessories, Ltd., George Street, Coventry.

Another Spicer speciality—a leather patchwork cushion suitable for use in sidecars.

water cases, or leather or fur foot muffs. It is astonishing the extra comfort obtainable by a good cushion, one of the items usually overlooked as part of the sidecar's equipment. The only suitable materials for a sidecar cushion are those which will not absorb damp when lying in the sidecar not in use. A leather or imitation leather cover is best, and, although it costs more than a fabric, the extra is well worth it.

When one considers wearing apparel, the scope of those in search of extra comfort is considerably extended, for without suitable clothing and hats winter riding can be decidedly unpleasant.

Saddle comfort is also an important matter, and those in search of improvement in this direction should consider the Terry spring saddle, and the Brooks and Tan-Sad cantilever sprung seats.

The value of a backrest is not fully appreciated by the tourist. Backrests are still to be obtained to fit most standard saddles.

For sidecar drivers there is the Float-on-air saddle cushion made by David Moseley and Sons, Ltd., of Manchester, an air cushion for fixing to existing saddles, and a most efficient shock absorber, as we can testify from personal experience.

While on the question of comfort and convenience, it will be well to remember that, in winter especially, it is annoying to the passenger to be

Comfort and Convenience.—

asked to disembark when the seat locker is searched for the tool roll. Tools should be carried in the tool-bags, but they have to be packed tightly to prevent rattling, so repacking may be a tiresome task on the road. A top tube box is most useful for carrying the tools which are necessary for ordinary wayside adjustments.

Head wear is another important point which makes or mars the pleasures of winter riding. Caps with ear-flaps are desirable—at least for the passenger—while an oilskin helmet, such as sold by Barbours, of South Shields, will often prevent a damp head for the driver. Gloves are another item, and for the

driver these should be a loose fit: and, if handle-bar muffs are fitted, the hands are kept warm, whether it be freezing hard or raining in torrents.

There are dozens of ways of keeping warm and dry in winter without attiring oneself to represent thecoxswain of a lifeboat. It is drivers and passengers who make no special precautions who state that winter riding is unpleasant, and place their machines in dock during what is often a very pleasant part of the year.

There is nothing quite so invigorating as a spin over frost and snow-bound roads if the sun be shining and advantage be taken of the many accessories now sold for the passengers' and drivers' comfort.

FOR THE COMFORT AND CON- VENIENCE OF PASSENGER AND DRIVER.

A Samson tool box for the top tube is a convenience on both solo and sidecar machine.

NUMBERED ROADS.

IT has been known for some considerable time that the Ministry of Transport has decided to number and classify the principal roads in the British Isles, thus following the example of our friends in France. A stranger may be dropped in France by an aeroplane on any main road, and he is able to tell in a moment his whereabouts, and the direction he should follow to reach Paris by the numbers on the signposts and kilometre stones.

While the proposed new system does not exactly follow that of the French, it is one which is complete, and it now only remains for the county councils to follow the scheme set for them by the Ministry of Transport.

England and Wales are divided into six sectors, radiating from London, bounded by the great highways A1, A2, A3, A4, A5, and A6. Sector 1 is to the

right of road A1, which is our old friend the Great North Road; Sector 2 is to the right of A2, the Dover Road, and the system is followed likewise up to A6, working round the map in a clockwise direction. All roads beginning in Sector 1 are numbered on the sectional radial system, and the numbers allocated to these roads with the figure 1 as the first figure; for example, A12, A110, B19, B156, and so on, and the same number is applied to all sectors; thus in Sector 4 the numbers are A410, B41, and so on. In addition it may be possible to find A47 in Sector 5, as roads do not necessarily terminate at a road bounding a sector, and this indicates that road A47 has its origin in Sector 4.

The whole system, together with illustrations, is described in a map published through the enterprise of the Michelin Tyre Co., Ltd.

Review of Next Year's Sidecar Outfits of all Types.

FOR 1922 there will be one great improvement common to each and every example of the most economical form of transport for two: the sidecar outfit will be more economical than ever. Not only have prices, without exception, dropped in the last twelve months, but there has been a considerable increase in the number of tested and proved lightweight outfits with engines of only 350 c.c. or under.

Although one or two of the larger class of big single and twin-cylinder passenger machines have been re-designed or modified to give increased speed and power, the prevailing note for next year will be greater convenience and comfort for both driver and passenger. The majority of the sidecars that have served us so well in the glorious road year of 1921 will be offered again with a very noticeable absence of change for the sake of change. This is as it should be.

Before proceeding with a review of the sidecar outfits of 1922 it is worthy of mention, however, that some form of lighting equipment will be included in the standard specifications of a greater percentage of complete outfits than ever before. This is following the now general practice in the car world, for no cars are now marketed without lamps.

Lightweight Two-strokes.

Some remarkable performances have been made in the big trials of 1921 by one or two of the miniature two-stroke outfits, but pride of place must certainly be given to the O.K. for its officially commended ride in the A.C.U. Six Days Trials. What is practically a replica of the successful machine will be marketed for next year, with a 2½ h.p. O.K. engine, all-chain drive, and a Moss three-speed gear box. Although handicapped by the absence of a third gear ratio, the little Hawker astounded the motor cycling world by

hauling a sidecar and passenger up Tornapress (Apple-cross) in the Scottish Trial. This machine probably represents the limit of simplicity in a sidecar outfit.

Connaught, Calthorpe, and Metro-Tyler have already proved that they possess more than sufficient power to get round a severe trial's course solo, and, therefore, they should be amply suited to the average potterer's sidecarring requirements. The same may be said of the Allon, New Comet, and Radco, while the Velocette and Ivy have several times demonstrated their capabilities by some wonderful hill-climbing feats, with full-sized passengers normally seated. Two models of the Beardmore are offered, although not for the first time; the 350 c.c. type embodies the Beardmore spring frame, but a lighter machine is sold as a "sports sidecurette."

Sidecar outfits varying from 2½ h.p. to 10 h.p. will be available for 1922 at prices between £90 and £200.

Lightweight Four-strokes.

When a 350 c.c. four-stroke won both T.T. Races, even the general public began to realise that the so-called 2½ h.p. engine of to-day has more power than the 3½ or 4 h.p. of bygone days. Nobody, therefore,

distrusts the 2½ and 3 h.p. sidecar machine, and the very names of its chief exponents form its own guarantee.

First officially introduced to passenger work only a month or two ago, the lightweight A.J.S. outfit will soon be a very familiar sight on the roads. All-chain drive, a three-speed gear box with kick-starter, and an amply strong frame eminently suit this little machine for the attachment of a light but roomy sidecar, also of A.J.S. manufacture.

As a passenger machine, the Royal Ruby lightweight is not so young, but the 1922 edition is essentially a new model, having a re-designed engine of 375 c.c. (nominally 3 h.p.) and a three-speed gear box of Ruby manufacture. The smaller 349 c.c. engine

EXAMPLES OF TWO-STROKE SIDECARS.

2½ h.p. CONNAUGHT.

will still be fitted to the sports model, and, with a lighter doorless sidecar body, it should be quite up to its work. With a 2½ h.p. Blackburne engine and a Canoelet sporting sidecar, the Verus is another excellent example of its type. Finally, the new Raleigh, with a 400 c.c. engine and Sturmey-Archer lightweight three-speed box, is a notable addition. It has final belt drive.

Mediumweight and Big Singles.

In popular fancy there is a big gap between the 2½ h.p. and 3½ h.p. single. Actually there is often less than 100 c.c. difference in engine capacity, although in practically every case, the larger outfit

3 h.p. IVY.

pays the higher rate of taxation—£4 against £2 10s. There are now comparatively few sidecars with engines of just under 500 c.c., but those which remain will ably sustain the reputation of their class. The 3½ h.p. Norton, all-chain Rudge, Sunbeam (the dual-purpose model), Coventry Eagle, and the Rover (now also offered as a sports outfit), are names that need little explanatory comment. Incidentally, these five are equally popular as solo machines.

The tendency, however, is to fit a larger engine for purely sidecar work, such machines as the new 4½ h.p. Sunbeam, 4½ h.p. P. and M., 4½ h.p. New Hudson,

3 h.p. BEARDMORE-PRECISION.

and the 4½ h.p. Beardmore-Precision carrying power units specially designed for sidecar work. The P. and M., of course, has a four-speed gear, while all four have all-chain drive and roomy, well-sprung sidecars with considerable luggage accommodation.

Big singles such as the 4 h.p. Norton, 4 h.p. Triumph, 4½ h.p. Ariel, 4½ h.p. B.S.A., 4 h.p. Bradbury, 4½ h.p. James, 4½ h.p. Quadrant, and the 4½ h.p. Excelsior, have made names that are known the world over. Only detail improvements have been made for next year; for example, the Triumph (which, with the B.S.A., still retains a final belt model) has a much roomier sidecar and simpler chassis. The 4 h.p. Powell will be obtainable with all-chain drive, while

2½ h.p. CALTHORPE.

the Excelsior has such useful items as 28×3in. tyres and a large capacity tank included in its specification.

Two of the leading proprietary engine manufacturers—J. A. Prestwich and Burney and Blackburne—are marketing "over 500 c.c." singles for next year. A new Rex-Acme will be fitted with the 4 h.p. J.A.P. engine, and such machines as the X.L. and Wolf will enjoy increased power from the larger size of Blackburne singles.

As the only large two-stroke single, the Dunelt is in a class of its own; and, although it makes quite an attractive solo machine, its engine has the "slog-

2½ h.p. O.K.

ging" powers specially desired by the sidecarist. An electric lighting set will be included in the 1922 specification.

Flat Twins.

Next on the scale of capacity comes a batch of flat twins, none of them exceeding 800 c.c. (It is, by

CAPABLE LIGHT FOUR-STROKES.

2 1/2 h.p. ROYAL RUBY.

2 1/2 h.p. VERUS.

the way, rather curious that no one should now market : 1,000 c.c. flat twin; with a short stroke and the gear box below the rear cylinder, such a machine should not be of unduly lengthy wheelbase.) Quite a different class of rider is catered for by the sidecar outfit with a horizontally-opposed twin engine; he is usually a man who prefers smoothness, silence, and comfort to sheer power.

The Raleigh, on account of its very efficient spring frame, may be considered as a leading example of this type of machine; for 1922 it will have an improved sidecar. The Mackechnie-Coventry Victor also embodies a very flexible suspension system which should be particularly suited for sidecar attachment. Two models of the Coventry Victor, of varying wheelbase lengths, are both marketed as sidecar outfits, while both the Victoria and the Ready fit the same power unit as standard. The 4 h.p. Douglas is already a most familiar outfit on the roads, but the o.h.v. 6 h.p. model is a novelty which promises to be an exceptionally speedy machine, probably one of the fastest standard sidecars of the year, and said to be capable of 60 m.p.h.

Noted for its silence, the Humber, now fitted with a luxurious Grindlay sidecar, is an attractive "gentlemanly" outfit, while the Sports Harley-Davidson, although designed for solo use, is strong enough and sufficiently tyred for sidecar haulage.

2 1/2 h.p. A.J.S.

Two-stroke Twins.

Before passing on to, numerically, the most popular passenger machine—the four-stroke V twin—there is a type which falls into the four-cylinder category as regards even running. This is the two-stroke twin—represented at present by the 3 1/2 h.p. Scott and the 5 h.p. Stanger. Apart from the

one point of classification in common, the two differ widely. The Scott is water-cooled, and its cylinders are arranged side by side; the Stanger is of the V type and is air-cooled. The Scott has a two-speed selective clutch gear and final chain drive; but we understand that a three-speed gear is at present under consideration. The Stanger has a Sturmey-Archer three-speed box and a belt to the rear wheel. Both possess the requisite power for sidecarring.

Four Cylinders.

Even torque is also the chief characteristic of the four-cylinder machine, and it seems a pity that the only two examples available to the public at Olympia should not be of home manufacture. Nevertheless both are excellent productions. Nominally rated at 7 h.p. the F.N. has an engine of 748 c.c., and embodies much from car practice, including shaft drive and a plate clutch in the flywheel. It will appear at Olympia with a new design of engine with overhead inlet valves. Rated at 10 h.p. the Henderson, in one model, is nearly double the capacity, viz., 1,301 c.c. 27 x 3 1/2 in. tyres are a striking feature of the American "four." Both of these machines make imposing sidecar outfits.

Passenger Motor Cycles for 1922.—

Mediumweight V Twins.

At least ten firms at Olympia will exhibit V twin outfits, with engines varying in capacity between 550 c.c. and 950 c.c. It is somewhat doubtful if these should be classified under the one heading of medium-weight twins, for they differ greatly in purpose, size, and weight. Not in every case do they represent their makers' largest and most luxurious models, and in such cases it is obviously correct to differentiate.

Taking first the examples where the so-called mediumweight twin forms the only model of that type on offer, and is consequently a highly specialised product with a performance reminiscent of 1,000 c.c., the names of A.J.S., Ariel, and James immediately occur.

4½ h.p. P. and M.

4½ h.p. SUNBEAM.

4½ h.p. ARIEL

4½ h.p. DUNELT.

4½ h.p. JAMES.

4 h.p. TRIUMPH.

4 h.p. NORTON.

SEVEN SINGLES SPECIALLY SUITED FOR SIDECAR SERVICE.

Twelve months ago the engine capacity of the A.J.S. was increased from 750 c.c. to 800 c.c. As a passenger machine the 7 h.p. A.J.S. needs little comment; a team of these machines won the coveted team prize in this year's Six Days Trials, and scores may be seen giving satisfactory service wherever motor cyclists congregate. A two-seated sidecar is a feature of one of the A.J.S. models, while another small but interesting point where the machine differs from the majority of its class is in the fitting of a separate lighting dynamo instead of the combined instrument.

Only in engine capacity does the 6-7 h.p. Ariel fall short of being ranked among the biggest of big twins. It has a long-stroke engine of 795 c.c. capacity, and is an exceedingly sturdy production which

Passenger Motor Cycles for 1922.—

should obviously appeal to the man who wants long service with a minimum of attention. An 8 h.p. twin Ariel will, however, make its appearance at Olympia as an additional model. Tyres and tank capacity are on generous dimensions.

The James is a similar machine, and, like the Ariel, is built entirely at the one works. For next year the James will have completely interchangeable wheels, improved leg-shields, complete aluminium chain cases, and a roomier sidecar. It was increased from 5.6 h.p. to 7 h.p. last year, and has done well in the chief reliability trials of 1921.

More truly entitled to the designation "medium-weight" are the 5.6 h.p. Rover, the 4 h.p. Indian Scout, the 5.6 h.p. N.U.T., the 5.6 h.p. Lea-

5-7 h.p. COVENTRY-VICTOR.

Francis, and the 5.6 h.p. Verus. Excepting the Indian these machines are fitted with proprietary engines—the Rover and N.U.T. with J.A.P.'s, the Verus with a Blackburne, and the Lea-Francis with a M.A.G. The Indian, although originally laid out as a solo mount, has been marketed as an electrically-equipped sidecar outfit for more than a year now. Both as a touring and light sporting outfit the Rover enjoys considerable popularity. Incidentally, the Rover was one of the first designs to use the Brampton spring link chain instead of a transmission shock absorber.

The N.U.T. belongs essentially to the sporting type, and certainly looks a very speedy outfit. The Verus, on the other hand, comes into the luxury class pure and simple; it is fitted with exceptionally extensive mudguards and a handsome saddle tank, aluminium footboards and aluminium chain cases.

Finally, there are two smaller editions of 8 h.p. twins. The Brough-Superior is now obtainable with a 592 c.c. M.A.G. engine, but otherwise with all the dis-

tinctive features of its larger brother. The other is the 6 h.p. B.S.A., now marketed in a lighter frame under the appropriate title of the "Light Six." The sidecar fitted to this model has also been considerably reduced in weight.

Big Twins.

Those who desire a big reserve of power are well catered for, the "1,000 c.c. sidecar" being the leading product of firms which thoroughly deserve the title of "sidecar specialists."

Detail improvements—in most cases with a view to avoiding over-elaboration—will be the keynote of the big twin outfits of 1922, and there will be few entirely new models in this class.

Three only of the larger passenger outfits have

**6 h.p. o.h.v. DOUGLAS.****5-6 h.p. RALEIGH.****4½ h.p. HUMBER.****REPRESENTATIVE FLAT TWINS.**

sidecar body as a sports outfit. The new rigid frame sports solo mount is also eminently suited for the attachment of a sidecar of the ultra-light sporting variety.

Carrying Three with Comfort.

An additional Royal Ruby for next year will be supplied with a tandem-seated body capable of accommodating two adults in comfort.

Indians have always had a reputation for being speedy passenger machines, despite the fact that they carry the not inconsiderable extra weight of a spring

spring frames—Matchless, Indian, and Royal Ruby—but each has survived several years of satisfactory use in the hands of private users. All three frames make use of the usual method of hinging the rear chain stays; but, while the Royal Ruby and Indian rely on leaf springs, the Matchless embodies coils. The latter type of spring is also used for the sidecar body suspension on the Woolwich production, which is now offered with a lighter semi-streamline

Passenger Motor Cycles for 1922.—

frame; and next year this reputation should be greatly enhanced by the introduction, under the appropriate name of the Indian Chief, of a 7-9 h.p. edition of the Indian Scout. A rigid, and consequently lighter, frame is the chief difference from the sprung model.

Other passenger machines deservedly and naturally noted for their high speed possibilities are the 7-9 h.p.

Harley-Davidson, the 8 h.p. Zenith, the 8 h.p. Brough-Superior, the 8 h.p. New Imperial, the 10 h.p. Reading-Standard, and the 7-9 h.p. Rudge. In its most popular form, the Harley-Davidson is fitted with an American system of combined lighting and ignition outfit, and is finished in a most serviceable shade of dark green. On account of the Gradua gear, the Zenith is essentially a "high average" machine,

MEDIUMWEIGHT V TWINS.

5-7 h.p.
ARIEL.

on this outfit.

There are several other rigid frame outfits with engines in the neighbourhood of 1,000 c.c. Perhaps the best-known examples are the Sunbeam, Rex-Acme, Hazlewood, Enfield, Excelsior, Chatter-Lea, B.S.A., Dot, Bradbury, and Ariel.

Fitted with an 8 h.p. J.A.P. engine, the Sunbeam is distinguished by neat and really efficient oil bath chain cases and an

4 h.p. INDIAN SCOUT.

6 h.p. BRADBURY.

and even the touring sidecar is fitted with a body on "sports" lines. Primarily intended as a *de luxe* solo mount, the Brough-Superior, nevertheless, becomes an exceedingly attractive and handsome sidecar outfit, with the addition of a specially designed model of the Montgomery sporting attachment. A choice of M.A.G. or o.h.v. or side valve J.A.P. engine is now

provided. The remarkable successes of the 2½ h.p. and 2¾ h.p. New Imperial lightweights this year have tended to obscure the consistent showing of the 8 h.p. New Imperial-Jap outfit in the most difficult reliability trials. Although there is nothing unconventional in its specification, this machine, nevertheless, "gets there" with great rapidity and regularity. Its price, too, will be exceedingly moderate. An 8 h.p. solo sports model will also no doubt be used for passenger work by one or two enthusiasts.

The Largest Twin.

The Reading-Standard follows British practice more nearly than most-American machines, but it is

7 h.p. JAMES.

attractive all-weather black finish. The sidecar body is finished to match, and the outfit worthily upholds a respected name in the motor cycle world. Last year the Rex and the Acme were marketed as separate machines, with, however, a strong family resemblance. The two are now combined as the Rex-Acme, and chain instead of belt drive has been standardised. A Blackburne engine and

Sturmev-Archer gear box need no description, but the long wheelbase of the machine and the correspondingly lengthy sidecar body deserve attention. The Hazlewood is an equally sturdy example of a machine embodying well-known components. The Enfield, however, is different; not only has it been one of the most moderately-priced big twins, but it is also unusually simple in design, light in weight (it has only a two-speed selective clutch gear), and noiseless in action—the mechanical silence of the Vickers-built engine accounting for this to no small degree.

A reputation for success in reliability trials stamps the Excelsior as an efficient and capable outfit. It has a J.A.P. engine, and the price is moderate.

Passenger Motor Cycles for 1922.—

Chater-Lea's, however, make their own engine, but it is on well accepted lines; here again the price is not high. An increase in engine capacity has brought the popular 6 h.p. B.S.A. into the 1,000 c.c. class, although, as already mentioned, the smaller engine will continue to be fitted in a less weighty frame under the title of the "Light Six." The larger machine should meet with a distinct demand from the family man who desires an economical means of transport for three or more.

Both the Bradbury and the Dot hail from the North, and are of characteristically sturdy build. The former is fitted with an engine of Bradbury design and manufacture, while the latter uses the popular J.A.P. unit. Both have chain drive, and are equipped with strongly-

built and comfortable sidecars. As described on another page of this issue, the Ariel twin will now be marketed in an additional model fitted with an 8 h.p. M.A.G. engine and all-chain drive. This machine will be similar to the 6-7 h.p. model.

It has been impossible in the course of this article to give prices, for, in the case of new or changed models especially, very few have yet been announced to the public; and it would obviously be misleading to quote 1921 figures alongside those of other firms for 1922.

There is no doubt, however, that many 1922 prices as divulged at Olympia will come as a most pleasant surprise to the would-be buyer. Neither will this tendency to a return to pre-war values be confined to any one type; many of the expensive twins being reduced.

Sidecars for Machines of all Types.

Proprietary Passenger Attachments for the 1922 Market.

LAST year the sidecar tended somewhat to a luxuriousness and size savouring of over-development; this year the new models to be offered for 1922 show a return to simpler and sounder lines.

The Show of 1921 also was characterised by a greater number of spring-wheeled chassis, but latterly the introduction of further samples of this type has abated, possibly due to the fact that general trade conditions have militated against inventiveness and the incorporation of improvements which, in most cases, increase production costs to some extent. In

able tendency to combine strength with lightness, simplicity, and the possibility of low manufacturing costs. The development of machines of small engine capacity as the propelling items of ultra-light passenger outfits has also spurred sidecar manufacturers to evolve soundly designed attachments from which non-essentials and consequent excessive weight have been ruthlessly eliminated. Grindlay, Watsonian, Montgomery, Sheffield-Henderson, and Canoelet names are

For lightweights and sports models: the Watsonian featherweight, which, with polished aluminium body, weighs but 60 lb.

one notable instance, the Triumph-Gloria to wit, the spring supported wheel axle has been definitely dropped, but such designs as the Grindlay, Sheffield-Henderson, and Millford-Rock are still being marketed, and the latter, at any rate, is of a design which is not necessarily complicated nor expensive, and its price has been appreciably reduced.

During the present year the general demand for lower prices has led to the introduction of many chassis of exceedingly straightforward design—a commend-

The Henderson featherweight model, a pioneer of light sidecars with a body which is nevertheless comfortable to ride in.

all borne on the lightest of lightweight sidecars, and some exceedingly attractive chassis are being included in the catalogues of all these makers. The Watsonian concern, for example, list a featherweight attachment with a total weight of 60 lb., made up of a 42 lb. chassis of very simple design and a polished aluminium streamline body weighing a bare 18 lb. The Henderson Featherweight, too, is about the same weight, with a chassis embodying the fewest possible lugs and having a coachbuilt body on graceful and fairly roomy lines.

Lightness in Excelsis.

Probably the limit in lightweight chassis construction is achieved by the Montgomery designer, who has

Almost the limit in the elimination of non-essentials. The Montgomery ultra-light sidecar, suitable for machines of low engine power. Separately shown is the very simple chassis.

A more ambitious sporting sidecar, the Dunhill, of projectile shape in polished aluminium.

evolved a remarkably simple construction in which one might almost say that the connections weigh more than the actual chassis itself!

In a somewhat heavier class, the sporting model by the same makers is of exceptional grace, and combines strength and a reasonable degree of comfort for its type. Grindlay also has achieved popularity with a sporting model with similar body lines and a type of suspension on quarter-elliptic springs which has been

The Hughes Torpedo model, fitted with step, scuttle dash, and aero windscreen.

so satisfactory that it is to be incorporated throughout the whole range of sidecars bearing this name.

Amongst sports type sidecars of still more roomy construction, the new Whitley and the popular Watsonian "R 34" are to be mentioned; the semi-flexible rubber-buffer couplings of the latter concern are of special interest in view of "Wharfedale's" recent advocacy in our pages of this type of connection; they have been tested for a year or more.

Turning to a heavier class of sidecar altogether, the more luxurious touring attachment suitable for

A spring-wheeled sidecar on sporting lines—the Grindlay Club model.

Ample body room distinguishes the Whitley sports model, which should be well suited to machines of the 4 h.p. type.

machines of 4 h.p. to 8 h.p., we may single out the products of the pioneer firm of Mills-Fulford, Ltd., as typical examples. This concern, of course, is maintaining production of the "chassis-less" Rock design, introduced last year, but it also has a range of staunchly constructed sidecars mounted on strong chassis of rectangular form having longitudinal

A speciality of Dunhills, Ltd.: the patent triangulated chassis used on the heavier touring models.

and axle members duplicated. Bodywork on these Millford productions is of unexceptionable quality.

Another firm specialising in high quality finish on a body and chassis of conventional design is the Whitley Manufacturing Co., while Dunhills also take a pride in highly finished and luxuriously trimmed bodies, which are mounted on a soundly constructed triangulated chassis. This London house also offers a sporting sidecar of "projectile" shape, but convenience of ingress and egress appears to have been neglected on this particular model.

For the average mediumweight touring machine: the Montgomery "No. 2." Notice the step which is fitted.

For goods or small live-stock: the Watsonian farmer's carrier sidecar.

Another sidecar for mediumweight machines: the Whitley standard model. Highly-finished bodywork is a characteristic of this production.

Between the average mediumweight and the most luxurious sidecars, the Watsonian Monarch holds a prominent position.

Commodious body design, luggage carrying capacity, and sturdy chassis construction, are features of these products of Sheffield and Coventry. The model names give the key to their qualities; that on the left is the Henderson "Elite," while the one on the right is the Millford "Luxury."

A Hughes touring sidecar with bulbous back.

Most of the firms mentioned produce double-seated sidecars for the family man.

Innovations in the springing of sidecar bodies are conspicuously absent in the 1922 programmes, and the great majority depend upon leaf springs of the C pattern; the Grindlay sidecars, however, as previously mentioned, use quarter-elliptics inverted at the rear, and upturned at the front. Certain Montgomery models use coil springs for the front suspension, the application being similar to the roller-lever springs of bicycle practice. Watsonian sidecar bodies are mounted on C springs at the rear, and double compression coils at the front, while the luxurious Henderson Elite is carried at the rear on a combination of semi-elliptic and coils which are adjustable for weight.

Trade Sidecars.

Quite a number of concerns produce sidecars specially suitable for trade delivery purposes. Watsonian, Millford, and the Willowbrook Co., all lay themselves out to meet the desires of motor cyclists who wish to use their sidecars for business purposes.

Folding Sidecars.

It might have been thought that the combined housing and garaging difficulties of the last year would have advanced the claims of the folding chassis to a greater extent, but the Hopley and Paragon constructions still maintain themselves in their solitary, but nevertheless successful, corners, fulfilling a demand which is probably only so limited because the public are not made sufficiently aware of their possibilities.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

SIDECAR CONNECTIONS.

Sir,—I was pleased to see that my plea for flexible sidecar connections has received the support of one of such long and wide experience as Mr. W. F. Grew, who writes in the issue of November 3rd; his patented application of the Hardy coupling (which I had momentarily overlooked) would appear to be ideal for a back bottom stay connection, even if the other connections were merely the usual long and usually "whippy" tubes.

Mr. Willey, I observe, weighs in again in last week's issue, but infuses the debate with an air of acrimoniousness which does not help matters forward. I did not ask for "sloppily fitting" connections but flexible ones of the same order of flexibility as that existing in, say, a car shackle bolt—freedom without slop. Perhaps Mr. Willey will be interested to know that the technical adviser of the Scott Co. was using a sidecar with the back connection (yoke) turned vertical in 1919-20, if I remember rightly, so that I have the satisfaction of thinking with another great mind! My own 1919 Scott, not so fitted, broke its back fork end after a season of heavy competition work.

May I repeat my contention that existing motor cycle frames are O.K. for the purpose for which they were designed, and that sidecars must be designed *not to break them*—not that the frames must be redesigned to withstand sidecar stresses.

I refuse to be inveigled by Mr. Willey into a dissertation on frame design in these columns. I may queer my pitch (and the Editor's guineas) for an article on the subject at a later date!

WHARFEDALE.

"ISSUED TO MEMBERS"—BUT NOT FREE.

Sir,—May I, as a constant reader, trespass upon your valuable space to reply to "Zenith DX 1997," who writes upon this subject.

The A.A. and M.U. Handbook for the current year is issued free to all new members upon joining, and at a cost of half-a-crown for subsequent numbers. This cannot be called exorbitant when the extraordinarily low annual subscription to the Association is considered.

The only way to put a stop to the present persecution of motor cyclists in this country is to join some body strong enough to stand up for itself and its subscribers. Catering entirely for the private owner, and having,

especially, the cause of the motor cycle at heart, the A.A. and M.U. is just such a body.

The history of the A.A. and M.U. is its best advertisement: let every motor cyclist give it a test. Then will the most popular, and yet most maligned, pastime come into its own and motor cyclists enjoy the privileges of other road users without its petty annoyances.

I have no connection with the A.A. and M.U.
Liverpool.

PREMIER EP 178.

Sir,—If "Zenith, DX 1997" will communicate direct with me, stating where he was informed that his handbook would cost him 5s., also giving his name and address, the matter will be investigated.

With regard to your correspondent's comment concerning a considerable portion of the handbook being devoted to the advantages of membership and the services rendered, I would like to state that of the 532 pages in the A.A. Handbook over 450 pages cover information in regard to appointed agents, hotels, touring, motor law, and many other matters which it is really essential for our members to know; therefore, the handbook is not, as your correspondent suggests, merely a compendium of services rendered by the Association.

I may add that the authorised charge for the handbook to motor cyclist members is 2s. 6d.

STENSON COOKE,

Secretary the Automobile Association and Motor Union.

COMPARATIVE TWO AND FOUR-WHEELER SPEEDS.

Sir,—At the foot of page 517, in your issue dated 27th ult., there is a comparison between the speed attained by the 1,100 c.c. cycle car, with two-seated body, and carrying two persons, and that attained by a solo motor cycle, and of only 88 c.c. greater capacity!

Why not have compared the four-wheeler's speed with that of the sidecars? Surely the only fair comparison.

In point of fact, the speed attained on Saturday, 22nd ult., has been exceeded since then, and the speed of the last lap in the 200 Miles Race should not be forgotten.

Are we to infer that the motor cycle quoted was not a "highly specialised machine specially designed for events of this kind?" Surely not! The four-wheeler, however, was an absolutely standard chassis, except for the engine and gear ratios, and, of course, tank capacity.

C. LEWINGTON.

THE MOTOR CYCLE

FORECAST AND GUIDE
:: : TO THE SHOW :: :

THE MOTOR CYCLE

FORECAST AND GUIDE
:: : TO THE SHOW :: :

4D

Next week's enlarged issue—the second of "The Motor Cycle" Show Numbers—will be of special interest to all who intend to visit Olympia. Among other important features it will contain a stand-to-stand forecast of and guide to the solo and passenger machines which will be exhibited there.

4D

WHICH IS THE WORLD'S BEST SOLO MACHINE?

Sir,—What machine is it that is sprung fore and aft, rides pot-holes like a dream, and does not play the deuce on grease? That with a suitable carburetter will tick over like a Leyland lorry, and scream off an acceleration to 60 m.p.h. standard? That, with proper tuning up for the track, will do a flying half-mile at 83 m.p.h., while its c.c. is but 398? That appears to have an unlimited capacity for revolutions, and feels like a four-cylinder to drive? That will take two up a hill of 1 in 7½ at 40 m.p.h. and revels in a light sidecar? That only fears others of the same make on the road? That has ideal weather protection and cannot hurt itself if it falls over? That has a sensible stand, sensible tool kit, and can be ridden with equal facility by man or woman? That with proper gudgeon pin fixings and stainless exhaust valves is as reliable as a Triumph or B.S.A., and is light on tyres? That holds the road as steady as a rock at 55 m.p.h. and over? That is the only really scientifically designed bicycle on the road?

The answer, gentlemen, is too obvious to be written.

Pinner, Middlesex.

A.B.C. RIDER.

Sir,—In my opinion the best way to judge is by the different makes of machines one sees whilst touring over popular roads, or speed and hill trials, or anywhere where motor cyclists congregate.

One will then notice the popularity of the Triumph machines. In my idea 20% of the machines now in use are Triumphs.

TB 4746.

Ashton-under-Lyne.

Sir,—The world's best motor cycle, in my modest opinion (as far as a solo heavy touring mount is concerned), is a 1921 P. and M. Unfortunately, I only possess a 1920 model, but there is not a great deal of difference. To back my opinion by visible points, not individual attainments (their engine power and general reliability has been publicly demonstrated in all reliability trials of importance), I would like to ask what other machine at any price has all the following good points or their equal:

- (1.) Two very large, easily opened, and firmly fixed toolbags.
- (2.) Ratchet brake, which is very useful, even for solo work.
- (3.) Pedal brake just under the heel—extremely powerful.
- (4.) Highly efficient and strong front mudguarding.
- (5.) Mechanical oiling, which oils directly and positively the big end, piston, and driving side crank case bearing.
- (6.) A two-speed gear which cannot be scrapped by a novice, of high efficiency, and exceptionally long noiseless life.

- (7.) Chains automatically oiled in strong cases with inspection covers.
- (8.) Very efficient shock absorber.
- (9.) Large straight through (yet quiet) exhaust pipe and silencer, fitted in an ideal position.
- (10.) Swinging end of rear mudguard.
- (11.) Celluloid-covered handle-bars, with controls in a very comfortable position.
- (12.) Valves easily ground in without removing the cylinders.
- (13.) Connecting rod milled from solid.
- (14.) Low down, strongly fixed lamp bracket
- (15.) Ideal magneto position.
- (16.) Decompressor.
- (17.) A front brake that can be used.
- (18.) Internal cone hub bearings.
- (19.) Exceptional leverage to kick-start, which works direct.
- (20.) Benzole-proof enamelled tank.
- (21.) Finish in detail, as well as polish, second to none.
- (22.) Most courteous and quick service—an important point.

Of course, it has its disadvantages; every bicycle has. In my opinion, they are:

- (1.) Rather slow—45 m.p.h. on a 5¼ to 1 gear.
- (2.) Decarbonising takes too long.
- (3.) No handle-bar or foot clutch control, unless you fit a foot control to the gear, which is easily done.
- (4.) Cannot fit knee grips.

I have, of course, no connection with Messrs. Phelon and Moore.

B.T.B.

Hale.

Sir,—I apologise for intruding once more, but, as one of the guilty participants in the discussion on solo machines, may I suggest that it is rapidly becoming aimless. Originally, I think, the question was as to which is the Rolls-Royce of solo machines, and not which is the best solo machine. There is a distinction. "Rolls-Royce" has become synonymous with luxury, and luxury means refinement, comfort, silence, and safety. Viewed from this aspect, I still maintain emphatically that no single-cylinder four-stroke can compete, and the four-stroke V twin, being the worst balanced engine obtainable, cannot even be considered. (I confess, however, to a sneaking regard for small V twins, of the Indian Scout type, though I am weakening my case by admitting it!)

However, the discussion need not be prolonged. A far more useful debate would be, "Which is the worst solo machine?" A few candid admissions from enthusiastic owners would undoubtedly help considerably in eradicating faulty design.

If some candid riders will give their views I shall be delighted. I do not think manufacturers will start actions for libel. After all, most machines have one good point. They go.

NORMAN WILLIAMS.

MERCURIAL FRENCH CHALK.

Sir,—"Ixon" has at various times given hints of a beneficial nature as to the carrying of spares, but I do not remember reading of how he carries his French chalk. Perhaps he will kindly give a little enlightenment. I have tried tins and airtight receptacles used by chemists and others, but always with the same result (no matter how tight the fit in the tool-bag is); everything else gets smothered with French chalk.

BL 9232.

Woking.

An artist's impressions of a strenuous autumn trial.

WHY DOES AN ENGINE ACCELERATE?

Sir,—The reason why an engine accelerates when the throttle is opened is that it gets more gas. Usual disclaimer. Leamington. COMMONSENSE.

Sir,—With a closed throttle the suction stroke merely creates a vacuum in the combustion chamber. On full throttle, the combustion chamber takes a full charge of gas at atmospheric pressure. Upon intermediate openings the downward piston stroke creates vacuums of degrees varying inversely as the throttle opening and the quantity of gas admitted.

In other words, a small opening admits a small amount of gas at very low sub-atmospheric pressure, the aperture for the inrush of air being smaller relatively to the period of induction and the vacuum to be filled than with a wider opening. It will be seen that, upon compression, this will be more intense when the gas was at atmospheric pressure upon the closing of the inlet valve than when it was at the same period at a pressure below that of the atmosphere; and the explosion will be more violent, correct mixtures in all cases presumed. H. C. DAVIES.

Sir,—Your correspondent "Nenesider" apparently overlooks the presence of a pressure of 14.7 lb sq. in. (atmospheric).

When the piston descends, causing a negative pressure in the cylinder, gas would flow to the cylinder if not partially held by the throttle, and the engine would rapidly accelerate to full load.

What actually happens is: The cylinder is only partially filled, therefore the initial pressure, instead of being probably 80 lb. sq. in., is much lower (a manograph diagram will register only 30 lb. sq. in. at times), the working pressure, or explosive pressure, is lowered, therefore the engine is really controlled by the throttle reducing the working pressure.

If this argument is followed to its natural conclusion with the two-stroke design, perhaps one of your readers may hit upon some solution to the four-stroking nuisance. I suggest a transfer port carburetter.

"Hons. Eng." gives a very lucid explanation except at one point. "The engine takes . . . a full charge whether the engine is going slowly on small throttle or fast on full throttle."

This seems to suggest the cylinder negative pressure and atmospheric have time to balance on a small throttle opening.

For various involved reasons (not connected with shorter time the valve is open), this cannot possibly take place. G. W. WEBB.

Sir,—I confess to being a novice, and recognise that some involved technical reason is the solution; but one point seems to me overlooked, and yet I cannot help thinking it must have some bearing on the matter. I refer to varying suction according to throttle openings.

I believe that factor to be greatly used in construction of speeded shutters in photography, but to make my point more clear. I should perhaps give an illustration.

Anyone who can take two close-fitting canisters or cylinders and put one inside the other will find the difficulty of pulling out the inner one, if one end of each is quite sealed and the whole reasonably airtight. By its own weight the inner cylinder is even longer in falling out if held vertical.

If one places a small hole in the sealed end of the larger cylinder the inner one comes out fairly easily. If the cylinders or canisters are large, one can experiment further, and find that a small hole, while rendering the withdrawal of the inner cylinder not only possible but fairly easy, is not so good as a larger hole, and so on.

May it not be, therefore, that, as the valve orifice is constant throughout, the piston drawing on a small opening cannot descend in the cylinder of an engine so freely as on a larger opening, even though propelled by explosive force after the compression stroke?

I suggest that the induction stroke is a factor to be reckoned with in that respect as a retarding influence to the ability of the engine to attain higher "revs.," possibly only a small retarding influence, but at least present.

JOHN TREWAVAS, JUN.

Sir,—May I be permitted to give my opinion upon the subject, but first let me quote "Boyles Law on Gases"? "When the temperature is constant, the volume of a gas varies inversely as the pressure."

Now, when an engine is running at a small throttle opening, the gas is drawn into the cylinder through a restricted area, i.e., partially closed throttle, and although the cylinder is filled with gas it is in a rarefied state, i.e., at less than atmospheric pressure (14.7 lb. per sq. in.), owing to the small time the inlet valve is open. If this gas were compressed to atmospheric pressure the total volume of gas in the cylinder would be far less than the full capacity of the cylinder at atmospheric pressure.

Likewise, as the throttle is opened, so would the gas be drawn into the cylinder at very much nearer atmospheric pressure, thus increasing the actual volume of gas at 14.7 lb. per sq. in. pressure. A.A.W.

Eastwood.

SUNDAY COMPETITIONS.

Sir,—In your November 3rd issue I read with great interest the letter of Mr. Samuel St. John.

The Sunday competition machines form a very small percentage of the vehicles on the road.

What about the hundreds of chars-à-bancs with their noisy, jovial loads, the thousands of cars and motor cycles and smaller fry, dashing to and fro in an irresponsible manner?

Perhaps Mr. St. John will be good enough to give us a clearly defined statement of the difference between "the law-abiding (2) Sabbath joy-rides" and the "Sunday competition rider who makes the day hideous with his uproar."

Personally, I think Mr. St. John's letter is a direct attack on Sunday riding generally, and not against Sunday competitions in particular. W. A. DOVENER,

Hon. Sec., The Bradford Motor Cycle and Light Car Club.

SUMMARY OF CORRESPONDENCE.

Some time ago Mr. A. W. Davies, in reply to a correspondent, stated in these columns his satisfaction with the Best mechanical oil pump on a B.S.A. He now writes that he has covered a further 10,000 miles in all weathers still without trouble.

"Rook" complains of boarding house charges in North Wales, having been charged £3 5s. for two nights' and one day's accommodation for two.

Mr. S. Williams wonders why "so many manufacturers of motor cycles spoil an otherwise excellent production by putting the magneto just in the rear of the front wheel."

Dissolved acetylene is preferred by "Night Owl" (Hinckley) either to plain carbide or electric lighting sets. He highly recommends this type of lighting equipment.

Two more correspondents, "20 m.p.h." (Birmingham) and "BJ 5406" (Dorset) revive the suggestion that the Tourist Trophy races be held for standard stock machines only.

"Devon" (N. Devon) complains that prices both in the new and second-hand markets are still too high.

Mr. G. H. S. Ellis considers that prompt payment of spares accounts would make a big difference in manufacturers' service.

Advance Details of 1922 Models.

A Sports Model Ariel and a New Big Twin.

Five Models for 1922, including an 8 h.p. M.A.G.-engined Mount.

IN addition to existing Ariel models, in which little change has been made, there will be marketed a new sports type. Selling at the very moderate figure of £87 10s., this new Ariel is bound to attract a considerable amount of attention. Fitted with the 499 c.c. Ariel engine (86.4×85 mm.) and three-speed gear box, it has an enclosed primary chain, lubricated by excess oil from the crank case, and final belt drive.

Decompressor, but no Kick-starter.

In connection with the engine, it will be remembered that a decompressor has been fitted for many years past, though in the latest type the operating pedal is attached directly to the decompressor instead of being connected by external links. The sports model has a handle-bar clutch control, but no kick-starter, so that the decompressor is a particularly useful fitting in this case.

Of standard construction, the three-speed gear box has a new type of gear operation, the lever and quadrant lying conveniently below and at the side of the new dome-sided tank.

An addition to the Ariel range is the 3½ h.p. Sports model, with three-speed gear and clutch, but without kick-starter.

Many detail modifications have been carried out, such, for instance, as the replacement of pannier toolbags by a circular metal tool box at the rear, while the tyre pump is also attached to the carrier in such a manner that it does not interfere with luggage capacity. A long exhaust pipe from the engine now leads to a welded sheet metal silencer of streamline formation, having a long

narrow final exit. A toe-operated belt rim brake is fitted to the rear wheel.

The front mudguard is fully valanced, and has a wide splash at the base, which does much towards protecting the engine and rider's feet. Besides the usual specification, which includes B. and B. carburetter, Best and Lloyd sight feed drip and pump, and 26×2½ in. Dunlop tyres, rubber grips are fitted to the handle-bar—a refinement which is not usual on standard machines.

An 8 h.p. Twin.

The standard 3½ h.p. three-speed Ariel will sell at £95, and the big 4½ h.p. single (chain drive) at £105. The 6-7 h.p. twin, with chain and belt drive, is listed at £110, and a new model, fitted with an 8 h.p. M.A.G. engine and all-chain drive, will be marketed at £125.

Two sidecars are marketed, the lighter model, for chain-cum-belt drive machines, selling at £30, while the special type, for all-chain drive machines, costs £5 extra.

All Ariel machines are fitted with the already well-known Ariel gear box, and; with the exception of the sports model, the spring saddle pillar peculiar to this firm is supplied. In addition, the new 8 h.p. model has internal expanding brakes in both front and rear wheels.

An 8 h.p. M.A.G.-engined Ariel, which marks the entry of this well-known machine into the full-powered class.

A Scottish Lightweight.

ONE of the few motor cycles made North of the Tweed is the Victoria, a product of the old-established Victoria Motor and Cycle Co., Ltd., of Glasgow. At last year's show this firm staged a 4 h.p. sidecar outfit at £125, which was, at that time, easily the cheapest outfit on the market. This year the leading Victoria model will be a two-stroke lightweight, embodying the well-known Villiers engine with flywheel magneto, and priced at £39 18s. for the single-speed model, £45 for the plain two-speed, and £50 with two-speed gear, clutch, and kick-starter.

One of the few representatives of Scotland—the 2½ h.p. two-stroke Victoria.

Quadrant Modifications.

A Low-priced, Long-stroke, Big Single Sidecar Outfit.

BESIDES the excellent finish and sturdy construction of the big single Quadrant the most noticeable feature is the attractive price at which it is to sell. Completely equipped with Sturmey-Archer three-speed gear, chain and belt drive, a sound specification throughout, and a deep-bodied coach-built sidecar with good upholstery, the $4\frac{1}{2}$ h.p. Quadrant is listed at £100, an extra £5 being charged for all chain drive. Without sidecar the two types sell at £80 and £85 respectively. Such prices for a thoroughly well turned out machine equipped with an engine of 85×110 mm. (654 c.c.), cannot fail to draw the attention of the buying public.

Sound Specification.

Regarding specification, the Quadrant remains largely unaltered, but a very neat circular section saddle tank replaces the earlier square type. Quadrant forks are, of course, retained, and it will be remembered that a rebound spring is incorporated in the design. The forks pass through the wide flat front guard, and the mudguarding throughout is sensible. Cast aluminium is employed in many places where sheet metal is more commonly used, and in addition the aluminium footboards, the silencer, and both front and rear chain guards are of the same material. A powerful Ferodo wedge type brake is fitted to the rear

One of the largest capacity single-cylinder outfits on the market—the $4\frac{1}{2}$ h.p. Quadrant, fitted with a 654 c.c. engine.

wheel, a rim brake being retained in front. We have had some road experience with the Quadrant outfit, and can testify to its roadworthiness and its pulling powers, for with its 5 to 1 top gear it is capable of taking a loaded sidecar up all normal main road hills. The standard sidecar as fitted is roomy, and contains a large locker in the bulbous back and a smaller locker under the seat. Fixed to the body, so as to

prevent rattle, the mudguard is of sensible proportions, and amply protects the passenger. Four points of attachment are provided for the stoutly constructed chassis, and the body is fully sprung. $26 \times 2\frac{1}{2}$ in. tyres are fitted, and the equipment is excellent as regards essentials. A shock absorber is fitted in the rear hub of the chain-driven model, and a choice of Amac or Senspray carburettors is provided.

Next Year's Hawker Models.

Range of Blackburne-engined Four-strokes in Addition to the Well-known Two-stroke.

THE Hawker two-stroke may be said to have found itself during 1921, so its manufacturers have decided not to interfere with its design, and the only alteration will be an improvement of the finish, which will be black with gold lines. Having made their reputation with the two-stroke, the Hawker Engineering Co., Ltd., Kingston-on-Thames, have decided to sell three Blackburne-engined models during the 1922 season. These will be fitted with the $2\frac{3}{4}$ h.p., the $4\frac{1}{4}$ h.p., and the $2\frac{3}{4}$ h.p. overhead valve sports pattern engines. It is interesting to note that the identical frame is used in every case. Of these, the smaller machine is fitted with the Burman two-speed gear, and clutch, while the $4\frac{1}{4}$ h.p. has the same make of three-speed gear.

Special features in these machines will include A.B.C. pattern hub brakes, both front and rear, and a saddle of the firm's own manufacture, the peak of which is hinged at the top tube, the springs being anchored to the top stays.

Another feature common to all models is the circular all-metal tool-box fitted to the rear of the carrier. Quite an attractive machine will be the $2\frac{3}{4}$ h.p. sports

A $2\frac{3}{4}$ h.p. Blackburne-engined Hawker. Such details as the cylindrical metal tool bag aer retained.

model fitted with the overhead valve Blackburne engine. This will have, all-chain drive, a three-speed gear, and clutch, but no kick-starter. The $4\frac{1}{4}$ h.p. model also has all-chain drive.

In the case of the $2\frac{3}{4}$ h.p. two-stroke machine, hinged front forks are retained, and all Hawker machines will be fitted with the latest pattern M-L magneto as standard.

If you are visiting Olympia for the Motor Cycle Exhibition during the first three days, take with you a copy of next Thursday's FORECAST AND GUIDE NUMBER OF "THE MOTOR CYCLE."

An 8 h.p. Bradbury for 1922.

Six Models, Four Sizes of Engines ; Next Year's Programme at Oldham.

FOR 1922 the Bradbury range is to include an 8 h.p. twin outfit of new design. As will be seen from the accompanying illustration, it is quite a handsome mount—an enlarged edition of the well-known 6 h.p. model with the exception that the seat tube is approximately vertical. The Bradbury three-speed gear box, with cork inset clutch, is used, and the wheels carry 28×3in. tyres.

The 6 h.p. model is practically unchanged except for minor refinements, which remark also applies more or less to the other models. These include three 2½ h.p. machines and a 4 h.p. single-cylinder sidecar model. The engine dimensions, weights, and prices are as follows :

	2½ h.p.		4 h.p.
Bore and stroke ..	74.5 × 80	..	89 × 89
Capacity	350 c.c.	..	554 c.c.
Weights	174 lb.	..	280 lb.
Prices	£60	..	£92
	6 h.p.		8 h.p.
Bore and stroke ..	74.5 × 86	..	80 × 99
Capacity	750 c.c.	..	996 c.c.
Weights	325 lb.	..	360 lb.
Prices	£117	..	£135

An entirely new Bradbury model, fitted with engine of 80 × 99 mm. = 986 c.c.

The three 2½ h.p. machines vary only in respect of the gear box. The first model is single-geared and has no clutch, the second a plain two-speed gear, and the third two speeds with hand control

clutch and kick-starter. The latter two models are priced at £75 and £80 respectively. All have chain-cum-belt transmission, but the three larger models are chain-driven.

1922 Harley-Davidsons.

Few Changes in Representative American Models.

Only minor modifications have been effected in the 7-9 h.p. Harley-Davidson machines.

IN common with some of the British makes, Harley-Davidson motor bicycles may be classified among those which have reached a stage in which innovations necessitated on the new models are of the most trifling description.

The chief alteration in the 1922 models is the change of colour, which is now a dark olive green—quite an attractive colour indoors, but not so serviceable as the light khaki colour, on which mud or dust are quite inconspicuous. Dark green, however, has this advantage: it is an excellent wearing colour, and any scratches or chipping of the enamel may be touched in easily, so as not to be noticeable.

The head lamp and electric horn are supported on the same bracket, and a quickly detachable lamp glass fitted.

For 1922 the popular flat twin Harley will have a guard instead of the completely enclosed chain case hitherto used.

Advance Details of 1922 Models.

So far as the 7-9 h.p. model is concerned, it will be sold, as before, in two patterns—the electrical and the magneto, the former being complete with dynamo generator manufactured by the Harley-Davidson Motor Co., Ltd. A small improvement has been made in the design of the distributor cover of this equipment, so that the terminals are below, in order that there shall be no tendency for wet to run down into the interior, as was the case with the old pattern.

Improved Mudguarding.

Other points worthy of mention on the big twin for 1922 are that the front mudguard is now deeply valanced, that the head lamp and the horn (fixed below it) are finished in black, while the external brake is operated by the rider's heel and the internal expanding brake by the toe, both pedals being on

The modifications in the electrical equipment include a new distributor, which shields the H.T. wires from rain. The disposition of the fuse box and accumulators is also shown.

the same side of the machine. The front chain is now entirely enclosed. Double dust caps are now fitted to both wheel bearings. It is interesting to note that British-made Bonniksen speedometers are now a standard fitting on these machines; the speedometer is mounted on the top tube and driven from the off side of the rear wheel.

Modifications of the Flat Twin.

As regards the 4 h.p. machine, the makers have ceased to enclose the chain entirely, and it is now protected by a guard. The tool bag is a very neat fitting, which is let into and flush with the top of the carrier. This model is an excellent solo mount, which will nevertheless take a light sidecar anywhere, and is a most satisfactory dual-purpose machine; it is also finished in dark olive green. At the present time this is America's sole representative in the flat twin class.

New Metro-Tyler Models.

A 5-6 h.p. Twin with Blackburne Engine, as well as the Two-stroke Models, to be Marketed

AMONG the several firms which have turned their attention to the sporting twin-cylinder may be mentioned the Metro-Tyler Co., Ltd., Banister Road, Kilburn Lane, London, W.10. Their latest production consists of a 5-6 h.p. twin fitted with a Blackburne engine, 71×88 mm. (698 c.c.). It is provided with all-chain drive and a Burman three-speed gear box and kick-starter.

Knock-out Hub Spindle.

So as to facilitate tyre repairs to the back wheel a withdrawable spindle is fitted. The front wheel bearings are of standard design. The magneto is carried behind the engine, and is driven by a chain, which is rather long, however. Careful attention has been paid to the mudguarding, the mudguards being wide and well valanced. The machine has a short wheelbase, low riding position, and wide handle-bars giving ade-

A new V twin Metro-Tyler, which marks another entry into the big solo class. The engine is a 5-6 h.p. Blackburne.

quate steering control. An Amac carburettor and B.T.H. magneto are fitted.

In general the machine follows accepted lines, but should be a thoroughly useful

high-speed touring mount. Special mention must be made of the roomy toolbag placed at the back of the carrier, and fitted with a lid provided with an ingenious fastener.

The Two Strokes.

So far as the popular 2½ h.p. M.T. two-stroke is concerned, the alterations are in detail only. The previously used oiling arrangement of the cylinder has been abandoned, the oil now being introduced into the inlet pipe, as this system is found to be more economical in manufacturing costs.

The sporting model of this type has now a roller bearing engine, and when used in conjunction with a sidecar has an Albion three-speed gear box and clutch. In the new sports model two-stroke the magneto and gear box are not enclosed, as is the case in the ordinary model where engine, magneto, and gear box form practically a unit.

Neat frame design is a feature of the 2½ h.p. two-stroke M.T. sports model, equipped with an Albion three-speed gear box.

If your visit to Olympia will be at the latter end of the week, "The Motor Cycle" Show Number (Dec. 1st) will assist you in your examination of the most interesting exhibits.

A New Indian Big Twin.

Indian Chief Model, an Enlarged Edition of the Indian Scout.

AFTER the Scout the Chief. Rumours via the American papers have warned us to expect something good in the new Indian Chief, and Indian enthusiasts will certainly not be disappointed. This new model is bristling with good points and is a very fine production. The new engine has the same dimensions as its predecessor—79×100 mm., 980 c.c.—but the design of the cylinders is similar to those of the engine with which the principal Indian records have been made during the present season. The radiating fins are more numerous and are considerably deeper, and have been brought down round the exhaust outlets. The large exhaust pipes are devoid of bends and lead straight into a generous exhaust pipe with a flattened end, and, notwithstanding this arrangement, the engine, we understand, is very quiet.

So far as the timing gear design is concerned, the Indian Chief engine has a separate cam wheel for each cylinder, which renders the timing more accurate.

Steadying the Cylinders.

To hold the engine rigidly in the frame, forged steel anchor plates are used, while the cylinder heads are bolted to a stay secured to the secondary tube of the frame.

The engine has, moreover, been considerably strengthened, and the new crankshaft is in. in diameter instead of $\frac{1}{2}$ in. Heavier flywheels are fitted. A "Y" type of induction pipe is now a feature of this engine, and leads towards a more easy distribution of the mixture, while special unions serve to eliminate all air leaks.

We now turn to the Indian Chief's electrical equipment. A new design of Splitdorf magneto and a separate Splitdorf dynamo are fitted, the latter driven off the timing gear of the engine.

An addition to the Indian range of machines—the Indian Chief—an enlarged edition of the 4 h.p. Scout. The engine is 79 x 100 mm. = 980 c.c.

The Princess sidecar of graceful design, designed to fit either the Chief or standard Indians.

Contrary to usual practice, there is no slip ring on the new magneto, but access to the distributor is obtained by removing a pin and swinging back a retaining bar. This exposes the distributor, the carbon brushes, and the segments, and the high-tension wires are merely connected by a pin passing through them and by pressure. The removal of the advance lever arm and of three nuts gives access to the interior of the magneto.

There are oil wells in both the magneto and magneto, the object of which is to prevent any oil which has leaked from the transmission reaching the instruments. A new ammeter is now

fitted to the top tube which contains the lamp switch, giving three positions—full on, dim, and off.

The Transmission.

The transmission is similar to that employed in the Scout, being through spiral gears, but is, of course, of increased dimensions, and the clutch is considerably larger, having nearly 100% greater frictional surface.

Following standard American practice, the footboards are hinged, the rear portion of the clutch pedal on which the rider's heel rests being also hinged and kept in normal position by means of a spring. The kick-starter passes through a lug in the frame supporting a 5 in. bearing. The Indian Chief has a rigid frame, but an excellent spring seat-pillar and a first-class saddle are provided. The front mudguard is in one piece with its valances, while the rear guard can have its lower portion hinged back so as to expose the tyre. This new model has the sidecar lugs forming part of the frame.

The Scout Model.

Little alteration has been made to the well-known Indian Scout, but in its design it follows many of the improvements made in its bigger brother. The new model has an improved spring for the front forks, the new type ammeter and switch, and a similar type of kick-starter. The other Indian model—N.E.—has the standard large valve type engine used last year, and the excellent Indian spring frame.

The A.J.S. Programme.

A New $2\frac{3}{4}$ h.p. Model. Detail Modifications to 7 h.p. Model.

AS regards the popular 7 h.p. A.J.S., only details have been altered. Of these, perhaps, the most important is the addition of a transmission shock absorber mounted on the engine-shaft, which sweetens the already smooth drive. Larger exhaust pipes are now fitted, and

a new and improved front mudguard has been designed. Further modifications are only such as are deemed desirable refinements after careful tests. An entirely new $2\frac{3}{4}$ h.p. model is, however, to be listed. The engine is founded on the existing side-by-side valve model, but,

apart from this, the machine has been redesigned and embodies several features of considerable interest. Full details of the innovations will be published in next week's issue of *The Motor Cycle*. In a "sports" form this new model is expected to be capable of well over 60 m.p.h.

1922 Matchless Models.

No Drastic Alterations. New Tandem-seated Sidecar.

LITTLE mechanical alteration is being made to the Matchless sidecar model, which has proved so satisfactory during the past season. In the suspension of the frame and of the sidecar, coil springs are exclusively used, except for the springing of the front of the body, where the springs are of the quarter-elliptical variety. There have, however, been one or two detail improvements in the sidecar. The spring bearers, instead of running clean through the body, now allow the seat to be lower, and the battery box to be below the level of the floorboard.

A Two-seated Sidecar.

An improvement in the appearance is effected by utilising plated brass beading round the edge of the body.

The principal innovation introduced for 1922 is the double-seated sidecar, in which the passengers are accommodated tandem fashion, and there is a separate screen for each passenger. The chief interest in this body lies in the ingenuity displayed in the design of the door, on either side of which is a combined hinge and fastener, so that either side may be opened, thus allowing a clear passage to either seat while using the same door. The sidecar is also provided with a collapsible floorboard in front, so that the extra foot room can be dispensed with when the front of the body is not occupied by an extra passenger.

We have already referred to the model

A feature of the Matchless double-seated sidecar is the door which is made to open either end. Observe the collapsible floorboard for the front seat.

J sports machine with rigid frame, the engine of which is specially tuned and has aluminium pistons. It is an excellent double-purpose mount, and will be shown at Olympia fitted with a light but comfortable sidecar. Among its special features may be mentioned the clutch, controlled by either hand or foot, a kick-up stand clip and a sidecar wheel stand

forming part of the frame holding the sidecar wheel.

There is also a model H sports model with light sidecar and spring frame, 28in. wheels, and a slightly higher saddle position. On this model the tools are carried in the sidecar seat, while in the model J the tool box is fastened to the top tube of the frame.

Detail Improvements to Rudges.

No Serious Changes in Design. Three-speed and Multi-gear Models.

RUDGE motor cycles have for many years enjoyed an excellent reputation for power and speed without sacrificing the equally important qualities of comfort and sturdiness.

Although no entirely new models or big changes in design have been introduced for 1922, these familiar Coventry-built machines should more than retain their present position in popular esteem. Especially is this so of the three-speed chain-driven models, which have undergone considerable detail refinement since their introduction this time last year.

As an example of a British-built big twin, the 7.9 h.p. model makes a particularly attractive sidecar machine, possessing a wonderful reserve of power. Instead of the multi-type of plate clutch a neat Ferodo insert clutch of large diameter has been substituted. It is also carried on

the engine-shaft, lying flush up with the crank case. An efficient shock absorber is incorporated, and on future models "keystone" shaped Ferodo inserts will be used instead of the circular pattern, thus giving an appreciably increased frictional area.

An aluminium chain case for the primary chain and guard for the rear chain are enamelled black, but the aluminium footboards are left in their natural finish. Front, rear, and sidecar wheels are quickly detachable and interchangeable, and both front and rear brake shoes are of the same pattern, being fully 9in. long.

Following usual Rudge practice, a separate oil tank is fitted behind the saddle tube, the pump being operated by a heel pedal. A Magdyno may be supplied with this model, the price of which

without the lighting set is £120, or with sidecar and interchangeable wheels £151. Fitted with T.T. bars, it should make an excellent semi-sporting solo mount.

The 3½ h.p. model differs mainly in tyre sizes (650×65 mm.) and the lighting equipment (a Maglita, again optional). A lighter sidecar is, of course, supplied, but both are very roomy and well finished.

Finally, one useful little improvement has been incorporated on all the 1922 machines. The spring-up stand, when in use, is now more nearly vertical, thus causing less strain, and enabling the machine to be lowered more easily.

It is also worthy of mention that the tool-kit includes a set of box spanners of only four sizes, which fit every important nut, and that a simple chain rivet extractor is supplied with the appropriate models.

A TWO-STROKE COULSON.

VERY little alteration has taken place in the latest Coulson models, which are now being produced in Birmingham by A. W. Wall, Ltd. A passenger model, engined with the new 4½ h.p. Blackburne, will be shown, and also a similar machine with 2½ h.p. Blackburne engine.

It is hoped, also, that a new sports model, with 350 c.c. overhead valve engine, will be ready in time for Olympia.

This model will have a three-speed Burman gear box with clutch but no kick-starter; it will also have footrests and simple, light fittings.

Both the touring models will have three-speed Burman gears with clutch and kick-starter. The Coulson front and rear springing will be retained, and the saddle will still be carried on the top tube; adjustable handle-bars are also a feature of all models.

Detail modifications consist of internal expanding brakes on each side of the rear hub, wider guards, and a general cleaning up of fittings, while a new type of aluminium footboard slightly splayed in front will be used. A new engine for the Coulson frame will be a two-stroke 2½ h.p. Liberty. This will be fitted with a two-speed Burman gear box with clutch and kick-starter, and final belt drive.

New F.N. Designs for 1922.

Overhead Inlet Valves on New 8 h.p. Four-cylinder and 2½ h.p. Shaft-driven Models.

ONE more example of how features of T.T. models are eventually embodied in standard touring machines is the introduction of new models of the well-known F.N. motor cycle.

In the T.T. races of 1914 Belgium's representative was a four-cylinder F.N., with overhead inlet valves centrally disposed in the cylinders. A new and enlarged edition of this model of 8 h.p. will be exhibited at Olympia, together with a new 2½ h.p. single-cylinder. Both will follow the general lines of the existing types, but close inspection will reveal several modifications, especially in the engine unit and in the gear box.

As will be seen from the illustration, the overhead inlet valves are operated by vertical push rods from the near side of the crank case. These rods can be removed in a few seconds by lifting them against the springs of the valves. Adjustment is provided for. The inlet valves are contained in cages.

The two-bearing crankshaft is supported by ball bearings, while both shafts of the gear box are also carried on ball bearings of generous dimensions.

In addition to this new 8 h.p. four-cylinder model and the o.h.i.v. single, which, of course, are shaft-driven, the existing models will also be marketed next year with detail improvements.

The new 8 h.p. F.N. engine with overhead inlet valves.

A New Sports N.U.T.

All-chain Drive as an Alternative to Chain and Belt Offered for Next Year:

THREE main models will form the N.U.T. range for 1922, all of which are V twins, two of them being of 3½ h.p. and the other of 5 h.p. Beginning with the lowest-priced machine this is offered with chain-cum-belt transmission for £110 and all-chain drive £120. The engine is a side valve V twin

64.5×76 mm. (496 c.c.), which has a ball bearing on the driving side of the main shaft. Druid forks, three-speed Sturmey-Archer gear, Brooks B170 saddle, and 26×2½ in. tyres form the main items of its equipment. This machine is also offered fitted with Lucas Magdyno light-

ing set and electric horn for £135 chain-cum-belt, and £145 all-chain drive.

A new sports model has been introduced, which embodies a specially-designed side valve V twin of the same dimensions as the touring model, but having aluminium pistons, roller bearing connecting rods, and large interchangeable valves.

A T.T. three-speed Sturmey gear with gear ratios of 4.5, 5.8, and 7.3 to 1, and T.T. regulation mudguards are included in the specification, but no carrier is fitted, and as is now usual on sports models, a kick-starter is dispensed with. The price is £120 chain-cum-belt, and £130 chain drive, and the weight 250 lb.

The 5 h.p. model is an enlarged "3½," the engine being 70×88 mm. bore and stroke (678 c.c.). Alternative gear ratios are offered, one 4.5, 7.3, and 12 to 1, and the other 5.1, 8.3, and 13.6 to 1. As on the other models, Druid forks and 26×2½ in. tyres are fitted, and again the option is given of chain-cum-belt or all-chain transmission, the respective prices being £110 and £120.

A speedy looking mount, the T.T. model 3½ h.p. N.U.T.

West Midland Open Trial Awards.

THE results of the Midland Centre Open Trial—practically the last open trial of the year—which was held last Saturday week, and reported in our issue of the 10th inst., show that about 75% of the starters qualified for an award of some kind, 25% gaining golds.

Sixteen teams of three were entered for *The Motor Cycle* prize; but, taking all facts into consideration, no outstanding team could be decided upon, the Ariel (Rollason, Woodcock, and Newey) being deemed equal with the Sun-Vitesse team (Bishop, Johnson, and F. C. Parkes). The private owner's prize, presented by Messrs. Norton Motors, Ltd., was gained by L. Crisp (4½ Humber). The other awards are as follows:

GOLD MEDALS.—L. Crisp (4½ Humber), R. W. Duke (4 Triumph), C. Greenwood (3½ Sunbeam), A. Rollason (3½ Ariel), W. Woodcock (3½ Ariel), S. H. Rhodes (3½ Wolf-Blackburne), A. W. Thrush (3½ Sunbeam), A. A. Symes (3½ Martinsyde), L. A. Bees (3½ Beardmore), J. H. Simpson (2½ A.J.S.), H. F. Harris (2½ A.J.S.), J. N. Roberts (2½ New Imperial), G. F. Mason (2½ Connaught), W. R. Bown (2½ Bown-Villiers), M. Bishop (2½ Sun-Vitesse), B. Kershaw (2½ New Imperial), F. J. Johnson (2½ Sun-Vitesse), F. C. Parkes (2½ Sun-Vitesse), J. M. Philpott (2½ Velocette), J. H. Walker (6-7 B.S.A.), L. Newey (6-7 Ariel sc.), and A. Watson (3½ Sunbeam sc.).

SILVER MEDALS.—R. B. Clark (8 Matchless), E. Poppe (4 Triumph), H. J. Stretton Ward (4 Triumph), A. C. Cope (3½ Douglas), F. S. Barnes (3½ Sunbeam), A. R. Evans (3½ Sunbeam), G. Butcher (3½ Sunbeam), J. G. Nickson (3½ Douglas), G. Strange (3½ James), H. R. Milling (3½ Scott), A. Smith (3 Calthorpe), L. H. Horton (2½ New Imperial), D. G. Prentice (2½ New Imperial), G. F. Povey (2½ Velocette), A. K. Smith (2½ Morris), G. S. Smith (2½ Morris), A. R. Edwards (2½ Lewis), V. Davis (2½ James),

L. Judge (2½ Velocette), F. W. Giles (7 A.J.S. sc.), T. F. Blumfield (6-7 Ariel sc.), W. H. Bashall (6 Martinsyde sc.), T. C. de la Hay (3½ Sunbeam sc.), E. Wheeler (3½ Sunbeam sc.), N. Hall (2½ O.K. sc.), N. Norris (10 Morgan), W. A. Carr (6 Morgan), F. Whitworth, jun. (3 Ivy), and F. T. Sibley (7-9 Rudge sc.).

BRONZE MEDALS.—W. Hope (3½ Norton), L. Cox (2½ Sun-Vitesse), F. J. Adams (3½ Norton), H. W. Parkes (2½ Sun-Vitesse), J. E. J. Whitaker (8 Matchless sc.), G. Tuckman (8 Matchless sc.), W. H. Nicholson (6 Martinsyde sc.), G. Dealey (2½ Velocette sc.), J. L. Cave (8.7 G.N.), and H. G. Uzzell (8 New Imperial sc.).

NO AWARD.—W. E. Jackson (2½ Bown-B.), A. Milner (2½ O.K.), J. Lidstone (7 James sc.), H. Greaves (4½ Beardmore sc.), F. Vallings (4½ Dunell sc.), and S. Goodwin (10 Castle Three).

RETIRED.—J. Wainwright (3 A.B.C.), W. I. Handley (2½ O.K.), L. Nicholson (2½ Omega), G. Hill (2½ Diamond), W. L. Dauskin (7-9 Rudge sc.), S. R. Philpott (6 Martinsyde sc.), T. F. Watson (4 Norton sc.), T. Peck (4½ Ariel sc.), R. Brown (3½ Sunbeam sc.), A. J. Carter (10 Castle Three), and H. Greatwich (8 Rover).

The Rendezvous of the T.T. Races.

Present Opinions as held in London and the Isle of Man.

THE silence of the Auto Cycle Union concerning next year's T.T. races would lead the motor cycle public to imagine that the making of arrangements are proceeding satisfactorily, but many on the outer circle of the A.C.U. organisation have confessed to us uneasiness at the delay in finally fixing arrangements.

With a view to throwing some light upon the present position, we have investigated the matter from both sides. A member of *The Motor Cycle* staff has visited the Auto-Cycle Union, and we give below a review of the position as seen in London.

At the same time we commissioned our regular Isle of Man correspondent to furnish us with the Manx view. This also is given here, and from which it will be seen that the Manx authorities have been moving in the matter.

The London View.

There is still some doubt as to whether the T.T. races will be held in the Isle of Man. So far, the guarantees promised by the I.O.M. representatives who attended the last A.C.U. General Committee meeting at Leicester have not been made in concrete form. The A.C.U. is naturally getting impatient, with the result that the Competitions Committee of the Auto Cycle Union have told the I.O.M. authorities that they must have a definite statement as to what the Island is prepared to do with regard to steamship facilities, the unloading of machines at Douglas, and such-like details which have been so unsatisfactory in the past, by November 30th. This date is mentioned so that the matter may be reported to the General Committee at the meeting which will be held on December 10th at the Grand Hotel, Bournemouth.

One step, however, towards the running of the races in the Isle of Man has been made, and that is the decision of the Tynwald Court to continue the Act legalising the holding of the races. The old Act recently expired.

From our I.O.M. Correspondent.

Readers of *The Motor Cycle* will be aware of the decision taken by the General Committee of the A.C.U. to hold next year's T.T. races in the Isle of Man as heretofore, provided satisfactory guarantees were received on certain specified matters. Members of the deputation, which met the A.C.U. at Leicester, on their return to the Island immediately took steps to comply with this resolution.

It seems that the Act which enables the Manx roads to be closed for racing expired in July last, and a new Act is necessary. His Excellency the Lieut. Governor has instructed the Attorney General to prepare an Act, and this will come before both branches of the Legislature, the House of Keys and the Council, at an early date. In the meantime, to bind both branches of the Legislature to the principle of motor racing, His Excellency the Lieut. Governor had inserted in the agenda of the past Tynwald Court, which was held on November 2nd, a declaratory resolution in favour of motor racing, and this resolution was practically unanimously carried by the Court. The effect of this resolution is that His Excellency has now been able to intimate to the A.C.U. that the necessary permission for the holding of the races in the Island next year will, in due course, be granted.

The next difficulty was with regard to the dates. The Management Committee of the A.C.U. and the Competitions Committee intimated to the Highway Board their previous decision to go to Belgium, and consequently there was no application before the Highway Board for dates. The Leicester deputation had several interviews with the Highway Board on this point, but, up to the time of writing, no application has been received by the Highway Board, which is the proper authority, asking for dates, and consequently the matter has not been settled, but the A.C.U. did write to His Excellency and suggested two dates, May 27th and 29th, a Saturday and Monday.

As a matter of fact the Governor has nothing to do with settling the dates, and an intimation to this effect was conveyed to the A.C.U. But the dates suggested are quite impossible. Saturday is the busiest day for the arrival of visitors, and it would be quite impossible to close the main roads in the Island on that day. Monday is the market day for agriculturists in the north of the Island. Therefore Monday would be equally impossible. The people in the Island cannot understand why the A.C.U. has asked for these dates. The A.C.U. can have the following Tuesday and Thursday with pleasure, even if, by granting these dates, it necessitates the R.A.C. postponing the proposed car races a week.

Sad Sunday to Go-

The next difficulty was with regard to restrictions on pillion seat riding, and on "Sad Sunday." The Leicester deputation interviewed the Highway Board and the Local Government Board, the responsible authorities. The Highway Board refused to give any decision, but the Local Government Board were in favour of repealing them.

Eventually, the Deputy Chairman of the Local Government Board moved a series of resolutions at the Tynwald Court, held on Tuesday, November 8th, the effect of which is that all previous regulations are withdrawn, but new regulations have been imposed forbidding the use of racing machines on any road on a Sunday, and all racing machines immediately on their arrival on the Island must have their racing numbers securely affixed to them.

In other words, these two new resolutions only carry out the rules imposed on racing machines by the A.C.U. themselves, and will therefore impose no hardship.

With the object of allowing those people along the course, who are awakened every morning by the early practices, an extra sleep on the Sunday, no motoring is to be allowed on the Sunday previous or the Sunday after a race before nine o'clock in the morning, with certain exceptions, such as motors conveying food, doctors, etc., and those motorists arriving by the early morning steamers, who will be permitted to drive to their hotels.

It is thought that these reasonable compromises will not inconvenience anybody in the slightest, as nobody surely will want to be on the road before that hour. These new proposals were submitted to the A.C.U., but, up to the time of writing, no word has been received from that body.

The A.C.U. officials have expressed themselves perfectly satisfied with the proposed arrangements to be made by the Isle of Man Steam Packet Co. During the whole of the practices there will be at least two boats a day between Liverpool and Douglas, and they will be first-class steamers, sailing from Liverpool at 10.30 a.m. and 3 p.m., and returning from Douglas at 9 a.m. and 4 p.m.

The A.C.U. has also received satisfactory assurances from the Douglas Corporation.

Landing Facilities.

With a view to facilitating the discharge of motor cycles at Douglas, the Tynwald Court of November 8th also passed a vote of £5,000 for the erection of an electric crane on the Victoria Pier, which crane will be completed before Easter. Satisfactory arrangements are also to be made in Liverpool by wider gangways, etc.

The only outstanding demand of the A.C.U. is that of the proposed grant or subsidy towards the A.C.U. expenses. The impression left on the minds of the Leicester deputation was that this was to be a guarantee against loss amounting to, say, £500. The A.C.U. has asked for a subsidy, which is quite a different matter. Up to the time of writing it is not known whether this subsidy will be forthcoming. The opinion in the Island is that they have gone a very long way to meet the reasonable requirements of the A.C.U. and the competitors. They think it would be degrading to the A.C.U. if they went round, cap in hand, asking people to subscribe. A guarantee against loss is quite a different matter. The Isle of Man people have still to be convinced that there was a loss on last year's T.T. races.

Times to Light Lamps.

Nov. 17th	5.6	p.m.
" 19th	5.4	"
" 21st	5.3	"
" 23rd	5.0	"

Number-plates to be illuminated thirty minutes earlier, *vide* Road Vehicles Registration and Licensing Order (1921).

Next Thursday.

The *Motor Cycle* second special Show Number—Forecast and Guide to the exhibits will be on sale on Thursday next.

Over £3,000,000 Surplus.

The amount of revenue from motor taxation to the end of October exceeds £10,400,000—over £3,400,000 in excess of the amount upon which the present scheme of taxation was based.

Sunday Competitions.

A Laycock correspondent to the *Keighley News* writes to that paper protesting against Sunday competitions. Fortunately, the majority of clubs agree with *The Motor Cycle* campaign against trials and speed trials held on the Sabbath, and complaints from other districts are exceedingly rare.

Imports and Exports.

The importation of motor cycles for October showed a marked decline compared with previous months, the value being down to £5,597. Export figures, however, show a slight increase against last month, but, compared with the corresponding month of last year, they are dependent reading. In October, 1920, we exported £259,810 worth of motor cycles and parts, but last month the total was only £61,654. Under the circumstances, which, as everyone knows, are as bad as they can be for export trade, even the slight increase on last month is welcome.

IMPORTS.

	Sept., 1921.	Oct., 1921.
Number of motor cycles	1,557	39
Value of machines and parts	£36,491	£5,597

EXPORTS.

	Sept., 1921.	Oct., 1921.
Number of motor cycles	425	430
Value of motor cycles only	£34,745	£35,034
Value of parts	18,841	26,620
Total	£53,586	£61,654

B.M.C.R.C. Annual Dinner.

One of the chief functions of Show week will be the annual dinner of the British Motor Cycle Racing Club, which is to be held at the Holborn Restaurant on Monday, the 28th inst. A very large number of club prizes won during the past season will be presented to members at this function, totalling in value over £300. In addition to these, the presenta-

Current "Chat"

tion will be made of the 200 guinea Miller Gold Cup for the 500 Mile Race. Tickets for the dinner, price 15s., are now ready, and early application should be made for them to Mr. T. W. Loughborough, B.M.C.R.C., Mill House, Warlingham, Surrey.

MOTOR CYCLE

GUIDE to OLYMPIA.

Intending visitors to the Motor Cycle Show at Olympia (Nov. 28th—Dec. 3rd) will appreciate the special contents of next Thursday's issue. It will form a convenient Guide to the Exhibits. Illustrations will be a feature.

ON SALE THURSDAY, Nov. 24th
— 4d. —

Special Features.

ECONOMICAL MOTORING FOR TWO.

MODERN THREE WHEELERS.

PASSENGER MOTOR CYCLES FOR 1922.

I.A.E. in the North of England.

The North of England Centre of the Institution of Automobile Engineers will hold the first meeting for many years on Wednesday next, at the Assembly Room, Education Offices, Chapel Street, Salford, Manchester, when Dr. L. Aitchison will read a paper on "Structural Chromium Steels." Invitation cards may be obtained from Mr. H. Alban Brayshaw, 5, College Lane, Paradise Street, Liverpool.

A Scottish Reunion.

The Scottish Ex-Signal Service Despatch Riders hold their second annual reunion on February 3rd, 1922, during the Scottish Show week. On this occasion the reunion will take the form of a dinner. All ex-Signal-Service despatch riders are invited to attend, and make the event a successful one. Mr. R. Watson, jun., 6, Cecil Place, Ibrox, Glasgow, is the organiser, to whom all communications should be sent.

Mr. J. L. Norton snapped outside the Town Hall, Durban, S.A. He is mounted on an ordinary "Big Four" Norton, and accompanied by his sister-in-law. Mr. Norton is on a tour round the world with the object of studying first hand overseas conditions.

The T.T. Races.

On page 624 the position regarding the T.T. races is discussed from the points of view of London and the Isle of Man.

Production Engineers.

A general meeting of the Institution of Production Engineers will be held on Friday, the 25th inst., at the Institution of Mechanical Engineers, Storey's Gate, London, S.W., at 7.30 p.m., when several interesting papers will be read.

M.M.G. Reunion.

A reunion is being arranged on December 3rd for those who served with the "H" Corps Signals as D.R.'s and those who served with the 3rd Motor Machine Gun Battery. It is hoped that a meeting at Olympia will be followed by a dinner. Will those who are interested write for details to Mr. P. L. Cearns, 8, Plaistow Park Road, Plaistow, London, E.13?

Minimum Weights.

We hear that the maker of a genuine lightweight motor cycle was refused the facilities of the A.C.U. Six Days Trials wherein to prove his production, because it did not weigh 132 lb. or more. It would seem that, while the present F.I.C.M. regulations are in force concerning minimum weights, the development of the genuine lightweight in the neighbourhood of 100 lb. is being throttled.

Class C Hour Record Beaten.

On Friday, the 11th inst., J. L. Emerson, riding a $3\frac{1}{2}$ h.p. Douglas (68x68=499 c.c.), beat the 50 and 100 miles, one and two hours records in Class C. The distances and times were as follows:

	h.	m.	s.	m.p.h.	k.p.h.
50 miles	0	39	51 $\frac{1}{2}$	75.26	121.11
100 miles	1	21	49 $\frac{1}{2}$	73.32	117.99
	mils.		yds.		
1 hour	74	471		74.26	119.52
2 hours	144	1,099		72.31	116.37

The B.C. and M.C.M.U. Banquet.

With reference to the banquet of the British Cycle and Motor Cycle Manufacturers Union on the 25th inst., we understand that the Gallery of the Grand Hall, Hotel Cecil, will be available for ladies and friends of the guests and members to listen to the speeches, which will commence about 8.15 p.m.

A musical entertainment is also provided. Admission passes to the Gallery can be obtained on application to the Union's offices, "The Towers," Warwick Road, Coventry, stating names for whom required.

Accommodation for A.C.U. Members.

Any A.C.U. provincial members who will be in London for the Olympia Show requiring assistance in securing suitable accommodation should notify their requirements at an early date to the secretary.

Proposed 200 Miles Sidecar Race.

In addition to organising the London-Holyhead trial during 1922, the Ealing and District M.C.C. is booking Brooklands Track for a 200 Miles Sidecar Race. So far, no one has attempted to run a long distance sidecar race, and this event should be both interesting and instructive. Valuable prizes will be offered, and the question of including a 1,100 c.c. class is being considered.

Credit where it is due.

From the letter published on this page, it will be seen that the Motor Legislation Committee claims the credit for the Ministry of Transport's decision to issue quarterly licences. We congratulate the Committee, but, as a rejoinder to Mr. Loughborough's letter, would add that the phrase, "as a result of continued agitation," was designed to embrace *The Motor Cycle* as well as the A.C.U. and A.A., since this journal has on many occasions urged the authorities to grant quarterly licences for motor cycles.

Severe Short Distance Trial.

The last event in the South Birmingham Club's programme for 1921 was run off on Saturday last, Bert Kershaw being responsible for the captain's trial over a really wicked course of ten miles of clay, ruts, and ice-bound roads. There were no main roads in the route. Swan Hill and Gravel Pit Hill, and the Gaby Glide were some of the tit-bits, but more difficulty was experienced in negotiating some less well-known parts of the course in view of the fact that the whole run was non-stop, and had to be traversed three times. When riders like G. Denley (Velocette) and Neville Hall O.K. Junior) only qualify for bronze medals it speaks volumes for the course. The results were:

CAPTAIN'S PRIZE (for best performance, any machine).—W. L. Handley (2 $\frac{3}{4}$ O.K. Junior).

NEXT BEST PERFORMANCE.—Solo, R. Cooper (2 $\frac{3}{4}$ Allon); sidecar, H. Uzzell (8 New Imperial sc.).

BRONZE MEDALS.—G. Denley (2 $\frac{1}{2}$ Velocette), L. Cox (2 $\frac{1}{2}$ Sun-Vitesse), B. Holt (2 $\frac{1}{2}$ Murphy), H. W. Parkes (2 $\frac{1}{2}$ Sun-Vitesse), L. E. Clulee (2 $\frac{3}{4}$ Allon), Neville Hall (2 $\frac{3}{4}$ O.K. Junior sc.), S. Bolderstone (7 A.J.S. sc.), and J. H. V. Wood (2 $\frac{1}{2}$ Connaught).

Taxation in 1922.

In view of the fact that taxation revenue in the first ten months of 1921 is 50% more than the estimated yield, it is natural that motor cyclists and car owners are asking whether taxation in 1922 will be reduced.

Release of "The Motor Cycle" Film.

During the week of the Motor Cycle Show at Olympia (November 28th-December 3rd), *The Motor Cycle* film will be included in the programme of the Polytechnic Cinema, Regent Street, London, W.

Noise Prosecution Dismissed.

Over the appropriate *nom de plume* of "Victorious," a Birmingham correspondent acquaints us that he was recently summoned for riding a standard 16H Norton fitted with the makers' usual straight through exhaust pipe and muffler end. The magistrates decided to hear the actual machine running, and, having done so, dismissed the case.

The History of Four-wheel Brakes.

One of the modern tendencies in automobile design is the adoption of four-wheel braking systems, the practice even extending to small cars. It is not generally known that this was a British invention. An informative article tracing the history of four-wheel braking systems appears in to-morrow's issue of *The Autocar*, illustrated with diagrams and photographs.

For A.C.U. Members Visiting Olympia.

As in former years, the A.C.U. has made very complete arrangements for the convenience of its members attending the Motor Cycle Exhibition. The Princes Rooms will again be reserved for the exclusive use of members. All A.C.U. members attending the Show should remember to take their membership cards, as these will be the means of admission to the Princes Rooms. The A.C.U. official stand in the Exhibition will be situated on the right-hand side of the hall from the Addison Road entrance. On the stand members of the headquarters staff of the Union will be in attendance, and full information and new literature respecting A.C.U. benefits can be obtained.

American Side Bodies.

For the first time American-built side bodies are to be imported with Indian motor cycles. British-built chassis will be used.

MOTOR CYCLE TAXATION.**A Letter from the A.C.U. Secretary regarding Quarterly Licences and Suggested Reforms for 1923.**

SIR,—Your leading article on the 3rd inst. commences by stating that the Ministry of Transport, "as a result of continued agitation," has agreed to issue quarterly licences to motor cyclists next year. But you do not state to whom credit for this development is due.

I suggest that it cannot be too widely known amongst motor cyclists that this advance is another example of the good work done by the Motor Legislation Committee. The three organisations on this Committee which have been particularly concerned in securing the issue of quarterly licences are the A.A. and the A.C.U., representing the users of motor cycles, and the B.C. and M.C.M. and T.U., representing the motor cycle trade. It is due to these three bodies pulling together

and not being at cross purposes—as were other organisations when the fight to retain the petrol tax was lost—that the Ministry of Transport has given way.

There is no hope of getting the present system of taxation changed in favour of a petrol tax during 1922, but it is not too early to agitate for this reform in 1923. Every motor cyclist can help the Auto Cycle Union in its efforts to secure this and other reforms by letting his friends know that, quite apart from the personal benefits membership of such organisations as the A.A. and the A.C.U. confers, membership of one or both of these bodies is the only way by which the motor cyclist can bring influence to bear on the Government.

T. W. LOUGHBOROUGH, Secretary Auto Cycle Union.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tador Street, London, E.C.4, and whether intended for publication or not must be accompanied by a 2d. stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 2d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

GARAGE RESPONSIBILITIES FOR PERSONAL EFFECTS.

Q. What is the legal view of the following loss of a coat? I put my motor cycle in a public garage and put the coat in the sidecar. When I came for the motor cycle the coat and gloves which were in the pocket were missing. The garage people say they are not responsible, but as I wore the coat into the garage, and it not being there when I wanted it, I think they should be made responsible, but before pressing the matter I should like your advice. The garage people gave me a ticket for the machine, which, of course, I had to give up on taking it away.—A.R.H.

It is very doubtful if you could prove liability on the part of the garage proprietors for the safety of your coat, unless it was specifically handed to some responsible authority and a receipt obtained. You would no doubt be able to base a successful claim upon such a loss if it was due to negligence or lack of reasonable precautions, but even so, it might be urged that there was contributory carelessness on your own part.

FROM HAND PUMP TO DRIP.

Q. I am running a 1916 4 h.p. countershaft Triumph, and do 100 m.p.g. (tested) regularly on a 5 to 1 top gear. I propose raising this to 4½ to 1. How will this affect consumption and speed? I have been used to a Best and Lloyd drip feed, and cannot get on with the Triumph pump. I therefore propose to fit a similar feed. Which is the best way to set about this? Can it be done without cutting up the tank? How many drops a minute should I set it to for ordinary running?—J.C.B.

It is not advisable to raise the top gear of a 4 h.p. Triumph unduly; it should not be higher than 4½ to 1, or you will probably lose both in speed and consumption. If you desire to fit a Best and Lloyd sight feed drip, you will have to cut the tank, and unless you are absolutely set on doing this, it would be advisable to retain the present system. With regard to the number of drops of oil, it is impossible to give a figure, since it depends on the condition of the engine and the type of oil used, but about thirty drops per minute might be tried. You will best discover this by experience, but you should take care to over-lubricate, and gradually cut down the supply rather than the other way round.

BELT BREAKAGES.

Q. On my single-speed Diamond-Villiers I have considerable trouble with the belt splitting at the side of the fasteners. The belt is a ¾ in. Dunlop. I always punch it with a proper punch through the second serration on the underside from the end. (1.) Do you consider the fault is mine through putting the fastener on wrongly? (2.) Would a ¾ in. or 1 in. belt be any better? (3.) If so, is there any objection to using a larger belt? (4.) Does it appreciably alter the gear ratio?—E.H.P.

(1.) The trouble you are experiencing is rather unusual if the belt is a new one. It is possible that the belt pulleys are not in correct alignment; also, the belt drill may make too large a hole, and so damage the canvas core of the belt. (2 and 3.) A ¾ in. belt would probably be satisfactory; but it is impossible to answer this definitely without inspecting the pulleys, as they may not be wide enough for a belt of greater section than that fitted as standard. (4.) The gear ratio would be very slightly raised.

MISFIRING ON FRONT CYLINDER.

Q. Only a very weak spark appears on the front cylinder of my 1920 8 h.p. Enfield-Jap, fitted with Lucas Magdyno, with the result that it will only fire at high speeds and when hot. I have cleaned the carbon brush and slip ring, and there is no shorting from the high-tension terminal to the plug. Apart from the size of the spark, the current is noticeably weak compared with the back cylinder when the terminal is held in the fingers. The contact breaker appears to be in good order.—K.B.

You can scarcely form an opinion as to the relative intensity of the currents at each high-tension terminal unless you have a more exact testing arrangement. We should imagine that, in all probability, the irregular firing is due to an air leak at the front cylinder. Make quite sure that all connections in the induction system are perfectly air-tight. Also tighten up the valve caps, sparking plugs, and compression tap of the offending cylinder, and make quite sure that the inlet valve is not worn in its guide.

A NEW TRIALS OBSTACLE. High Oak Hill, near Bewdley, which is approached from a small watersplash. It was included in the recent West Midland Trial.

ACCUMULATORS SPILLING ACID.

[?] I should be glad if you would give me any information respecting the following: (1.) I have a lot of trouble to keep the acid in the accumulator of my lighting set (dynamo) on my motor cycle. Is there any paste or the like that can be used in place of acid with equal effects?

(2.) If so, what is it?—G.L.G.

(1.) You do not say from what cause the acid comes out of the accumulator. If it is due to vibration, possibly an improved type of vent plug would improve matters. If the trouble, however, is due to over-charging or charging at an excessive rate, this is a matter for modification of the dynamo, either by driving at a less speed or by using a resistance in the charging circuit. (2.) Paste electrolytes have been manufactured, but their use is not common, and the majority of accumulator makers do not recommend them. The study of a book on electrical lighting apparatus, such as "Electricity and the Motor Car," would assist you in your difficulty.

ABNORMAL BEARING WEAR.

[?] I have a $2\frac{1}{2}$ h.p. machine, which is lubricated by semi-automatic drip feed; and, although only purchased new three months ago, in this short time I have had to return it to the makers to have the big end bearing rebushed; and now, after less than one hundred miles, and in spite of lubrication, there are signs of big end bearing play again. The engine has nearly $\frac{1}{4}$ in. side play. Do you think this is anything to do with it? I may say that thirty drops of oil per minute is the correct feed, but I have been giving it about forty per minute without any signs of over-lubrication, and have not opened the throttle more than half-way.—D.D.

There is absolutely no reason why the big end bearing, if reasonably well designed, should not give from 7,000 to 10,000 miles service. Of course, a new machine, especially one with plain bearings, requires a comparatively large amount of oil until the engine is run in; but it should not be necessary to allow more than forty drops per minute through the drip-feed lubricator. You do not give us very much information, nor do you mention the make of the engine; and, therefore, we are unable to advise you as to what you should do under the particular circumstances. The excessive end play will not cause serious harm, but it will probably result in noisy running.

READER'S REPLY.

NO POWER.

Your correspondent "T.L." complains in the issue of November 3rd of his Levis engine tiring and stopping every few miles. I had the same trouble with a brand new two-stroke machine which fizzled out on its first journey; it would start again immediately, go on nicely for a few miles, and then repeat the performance *ad lib*. All the makers could advise was to try a different plug. I tried plug after plug, but they made no difference. After putting up with the inconvenience for nearly six months I wrote to the makers of the magneto. They replied that from my description it appeared as though

the condenser of the magneto was at fault, and asked me to take the machine to them and they would put it right. I made all arrangements to do this, and the day prior to my making the journey a fellow motorist advised me to have a new high-tension cable fitted; I did so, and had no further trouble. The next day, instead of going to the magneto works, I did sixty miles non-stop at a better speed than ever I got before, and since then I have done non-stop journeys of eighty to ninety miles. What I cannot understand is why the makers of the machine, engine, or magneto, to say nothing of numerous motor mechanics, could not have made such a simple suggestion.—A.A.

EXPERIENCES WANTED.

Readers' replies to questions published under this heading should be sent to the Editor, "The Motor Cycle," Hertford Street, Coventry, when they will be forwarded direct to the querists concerned.

"A.C.H." (Forres).—1919-1920 o.h.v. Henderson: speed, reliability, valve adjustments, consumption, any other information.

"C.B." (Wrexham).—Sports Sunbeam: Durability, reliability, and maximum speed.

"D.L.P." (London, N.W.1.).— $3\frac{1}{2}$ h.p. Norton: Belt drive (Model 9), speed, climbing, reliability, and life of belt; ease of control in traffic with or without Philipson pulley.

"A.O.R." (Warrington).—1922 G.N., with sunk dickey: Noise and comfort.

"G.C.H." (Cardiff).— $2\frac{3}{4}$ h.p. Douglas two-speed for light sidecar work: Advisability of reboring worn cylinders and fitting oversize pistons instead of replacing new standard ones.

"J.L.F." (Bristol).—Dunelt, with sidecar: Reliability on tour, hill-climbing, durability, fork springing, and general experiences.

"A.F.B." (Winkelholme).—Any kind of mechanical oil pump fitted to a 4 h.p. Triumph or similar machine.

"L.W.A.L." (Haileybury).—4 h.p. Indian and Scott-Squirrel for sports solo use: Speed, acceleration, reliability, finish, and consumption.

"A.T.B." (Hastings).—8 h.p. Royal Ruby, 1921 spring frame.

"F.H.L." (Amsterdam).— $3\frac{1}{2}$ h.p. o.h.v. Douglas: Reliability, slow running on top, comfort, steering (especially on bumpy roads), noise of valves, transmission, and exhaust.

Important Dates.

Mon., Nov. 28th, to Sat., Dec. 3rd—
The Olympia Motor Cycle Show.

Sat., Dec. 3rd, to Tues., Dec. 13th—
Brussels Show.

Mon., Dec. 26th, Tues., Dec. 27th—
M.C.C. London-Exeter London Trial.

Sat., Dec. 31st—N.W. London M.C.C.
Twelve Hours Open Winter Trial.

Fri., Jan. 27th, to Sat., Feb. 4th, 1922—
Scottish Car and Motor Cycle Show.

Sun., Mar. 5th, 1922—Argenteuil Hill-climb (France)

Mon., Mar. 6th, 1922—La Turbie Hill-climb (Nice).

In Sweden.

A 4 h.p. Wolf-Blackburne, ridden by N. Ohlsson, recently gained an award in a petrol consumption test at Stockholm, covering $44\frac{1}{2}$ km. on one litre of petrol (approximately 130 m.p.g.).

Winter Overhauling.

As an inducement for Triumph riders to have their machines overhauled at the works during the winter months instead of in the spring rush period, the Triumph Co. offer a special discount of 10% off all overhauls which exceed £5. This applies to November and December only.

Tyre Valve Fittings.

A general price reduction of Schrader tyre valves, pressure gauges, and other tyre accessories is announced. The makers, A. Schrader and Son, Inc., now have British works in full working order at Victoria Road, Willesden Junction, N.W.10.

Prop Stands.

"Ixion," in his article on "Prop Stands" (*The Motor Cycle*, November 3rd, page 553), dealt with a special and now obsolete edition of the Bowland stand, which is now made in three different patterns to suit various types of motor cycle.

Two-stroke Gaskets.

A particular grade of leather which is claimed to be specially suitable for the joint between cylinders and crank cases is being offered for sale by A. Mason, 60, Hill Top Mount, Harehills, Leeds. On two-stroke engines it is anticipated that the Zephyr leather washers will eliminate all compression losses at the most vulnerable point, and although we have not yet tested it, a sample washer submitted appears to be an excellent thing for the job.

A Matter of Usage.

In our issue of November 3rd a querist mentioned that his rear brake was steel-lined, "unlike the A.J.S. which is Ferodo-lined." No doubt the phrase was used in a general sense, as it is often applied to friction linings, just as the patented name "petrol" is applied to all motor spirits. In justice to Cresswells, Ltd., of 44 and 45, Exchange Buildings, New Street, Birmingham, however, it should be mentioned that the A.J.S. machines have brake linings of their speciality "Chekko."

For Jointing Purposes.

Metalastene is the name of a sort of aluminium paintlike preparation packed in tubes by the Metalastene Co., of Poulton-le-Fylde, Lancs. Its purpose is cylinder and pipe jointing, and it appears to be a good line for its particular purpose. We have jointed an inlet dome and induction pipe with it, and a previous "blow" is now non-existent.

WORLD - WIDE VICTORIES.

Douglas

WINS

ANOTHER CHAMPIONSHIP.

At the last B.M.C.R.C. Meeting of the season, held at Brooklands, on Saturday, November 5th, the event of the day — 750 c.c. Championship Race — was won by Mr. C. G. PULLIN, riding a standard DOUGLAS

AT 76.49 M.P.H.

In both Brooklands solo Championship Meetings this season, in which DOUGLAS machines were entered, they proved themselves undoubtedly the victors of each of these solo class races, the former being won in October by Mr. J. L. EMERSON

AT 79.9 M.P.H.

with Mr. C. G. PULLIN running second on another DOUGLAS, covering a lap

AT 82 M.P.H.

SOUTH AFRICA. The Rand Motor Cycling Club, of South Africa, held a keenly contested Hill Climb, which was handicapped according to c.c., and run off in heats by the very large number of entrants. It resulted in

P. FLOOK, 3½ h.p. Standard Sports Model, being **FIRST**, beating all types and powers of machines.

"The Star," Johannesburg, says: "Riding superbly, Flook literally leapt the last corner and roared over the line at a speed I have never seen equalled on the top of that hill. The 3½ h.p. Douglas he rode is a Sports model, and the hottest of hot stuff."

ITALIAN RECORD. We have received information that Troncon Guiseppe, riding a Douglas in the 350 c.c. class at TREVISO, established new time for the kilometre record.

Evidence is reaching us from all quarters of the world that the Douglas machines are still maintaining their high position in the competition sphere.

SEE THE NEW 1922 MODELS, RANGING FROM 2¾ H.P. TO 6 H.P., AND FROM £75, ALL FULLY EQUIPPED.

Terry's

patent

Spring Links

absorb bar vibration—stop wrist ache, and increase motor cycling comfort. When you fit the spring links, the front wheel kicks are not carried to the wrists. Thus the machine will glide over the roughest surfaces easily and smoothly at speed.

This stops sidecar bounce, and saves you the trouble of holding the sidecar down when you are running empty No. 978. Terry's patent check spring sidecar fitting. Very best quality workmanship. 5/- pair, from your Agent

Suitable for all Link Types.

Up to 2½ h.p. solo	12/6	pair
2½ h.p. to 6 h.p. sidecar	15/6	"
Douglas 2½ h.p. only	15/6	"

Telephone: Victoria 56.

Three of our leading motor car manufacturers are now fitting

AYRTITE SLEEVES

on every car they send out, in order to minimise wear in Valve Guides and Valve Stems, and thus prevent the engines deteriorating from their original state of perfection.

AYRTITE SLEEVES

are *desirable* upon new engines, but *absolutely essential* upon engines no longer in new condition, particularly Motor Cycle engines, for cold air leaks past the Valve Stems and Guides, upsetting the mixture, making the engine sluggish, difficult to start and wasteful of petrol.

AYRTITE SLEEVES

cure those troubles and make the considerable expense upon new Valves and Guides unnecessary.

AYRTITE SLEEVES

cost very little—**2/6** each, and are sold on the understanding that if they do not do what is claimed for them, they can be sent back and the money paid will be refunded.

Now is the time to fit them. Here are a few testimonials from motor cycle owners. We have over 6,000 more of the same sort, all unsolicited.

- "I get 11 more miles to the gallon, sweeter running, easier starting; in fact, a general improvement."
- "For the improvement in starting alone they are worth the money."
- "They have increased my mileage 10 m.p.g."
- "The total difference surpasses comment."
- "The running is greatly improved since fitting the Sleeves."
- "I have fitted the Sleeves; the running is much easier, and I have reduced all my jets. The Sleeves give a new lease of life to the engine."
- "I have fitted the Sleeves and consider them the finest little fitting I have dropped on yet. The engine pulls better with less petrol."
- "I fitted the Sleeves and could not believe I was on the same machine. It is a great improvement. Power is improved and petrol consumption is less."
- "The Sleeves have given a marvellous improvement to my engine."
- "I have fitted the Sleeves and find they do all you claim for them. The engine runs quieter, starts easier, and uses less petrol."

If your Garage does not stock, the appended form may be used.

The machine has done very well during the year I have had it. Recently I did a tour of some 500 miles in the South of England. I carried my wife, two children, and myself, tent, eleven blankets, cooking utensils, ground sheet, sheet to cover sidecar and machine, two tyres, and a large bundle of clothes. I had the machine weighed with all on, and it was over 11 cwt., no trouble except a puncture or two in the back wheel. Camped out several times. I thought it was pretty good carrying the weight it did.

Guernsey, 4th October, 1921.

**FAMOUS FOR QUALITY & COMFORT**

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—First 12 words 3/—, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to **ILLIFFE & SONS Ltd., and crossed** Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue. Advertisements that arrive too late for a particular issue or that are crowded out will automatically be inserted in the following issue unless accompanied by instructions to the contrary.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only thenumber will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. Readers who reply to Box No. advertisements are warned against sending remittance through the post except in registered envelopes; in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor. Carriage is to be paid by the buyer, but in the event of no sale each party pays carriage one way. The seller takes the risk of damage in transit. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, 10/-. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Illiffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

A.B.C.

A.B.C., brand new; £85.—C.S., 14, Swaton Rd., Row, E.3. Tel.: E3155 [8268]

All letters relating to advertisements should quote the number at the end of each advertisement, and the date of the issue. Motor Cycles advertised by private owners are, when desired, marked (P).

My friends were stunned! I won the Challenge Cup! A perfect example ! !

From all over the British Isles I am daily receiving wonderful testimonials for my numerous special accessories made especially for Douglas Motor Cycles. Mr. John H. Darlington writes from Cheshire:—"Your Exhaust Pipes not only add to the appearance but give an increase of power. My friends were stunned, and you will get one or two customers from this town."

Mr. H. Blackoe writes from Kirkham: "Everyone says they are an excellent example of coppersmith's art."

Mr. Charles F. Stagg, Newport, writes: "I received pipes before the speed trials and was successful in gaining the Challenge Cup for fastest time in the 350 c.c."

These are but a few of the wonderful expressions of opinion I have received, proving beyond all doubt that as an Exhaust System, "Zoom! Zoom!!" stands by itself. Its mellow tone offends no one, yet the free passage for the exhaust gases and the enormous area for expansion permits the engine gaining its greatest power. Many agents are now fitting "Zoom! Zoom!!" One Garage alone has taken over twenty pipes and they say the prompt attention they receive from me is an object lesson to some of the older traders.

My service is a return service—everything you order you get by return post, and if you are not satisfied, return the article, and your money is returned to you without any deductions.

My price for Zoom! Zoom!! is only 30/- An ordinary Silencer costs you 37/6, and I could not have manufactured Zoom! Zoom!! six months ago for twice this amount:—remember it adds £10 to the appearance of any Douglas,—apart from efficiency.

Do you want the new 3½ h.p. Sports Model Douglas? I guarantee them to do 75 m.p.h.

W. G. Coram

Official Douglas Agent,

140, Victoria Street, BRISTOL.

GEARS

REPAIRED IMMEDIATELY

We make a speciality of prompt and efficient REPAIRS, and GUARANTEE that when a Gear leaves our works it is in perfect order, so, if in trouble with your Gear, it is to your own interest to send it direct to us. This is the most satisfactory method and quickest, for we submit quotation same day, and repair immediately on receipt of instructions. If quotation not accepted, no charge.

REMEMBER.

We undertake to repair your gear while you or your messenger waits.

WHEN SENDING REPAIRS:

1. It is advisable to send complete wheel.

2. A letter advising as to date despatch, station sent from, and mark and number of hub should be posted, and, MOST IMPORTANT, two labels bearing sender's name and address on reverse of both should be tied to the wheel.

Station for Callers—Heston-Hounslow, District Ry.

COUNTY ENGINEERING CO.

"An all-round Man, but—"

"You're right, old man, but I happen to know that, in spite of it, he's out of a billet. He's a fair salesman, has a smattering of languages, knows a bit about clerical work, and one or two other things, but doesn't really 'shine' at any one thing.

Qualifications like that aren't good enough to-day. The man who wishes to get on *must* specialise. Take Jack Smith, for instance. Went back to his old job as a clerk after the war—now he's getting £600 a year as Accountant to an Engineering firm.

How did he do it? In the same way as I did—took a Course of Postal Tuition under Wolsey Hall. He went in for Accountancy while I chose Secretarial work. We sat for our Final Exams. the same week.

Why don't you take up something like that this winter? It not only 'bucks you up' all-round, but it's the quickest way to promotion."

Write for **FREE GUIDE** and Specimen Lesson to the **Director of Commerce, Dept. AL9**

Wolsey Hall, Oxford

Cut out waste of oil

A Tin of oil will last you twice as long, and you will have a more efficient engine, if you use a **BEST Automatic Oil Pump**.

One delighted user says, "I have not had the slightest trouble with it, and this, combined with a big economy in oil, easier starting, and smoother running, makes me more pleased with it every run I have."

Why not fit one to your machine? It costs only **25/6**—plus cost of fitting

You can learn all about it from a free booklet called "The 'Best' Way" May we send you a copy?

Engineer, HAMPTON-ON-THAMES.

And I thought I'd never get it off.

—with soap he wouldn't but Gre-Solvent

will remove all grease and dirt easily however grimed your hands may be after overhauling the car, "Gre-Solvent" will make them white, soft, and smooth.

It is infinitely superior to any soap, more economical, and more convenient, for hot water is not necessary.

Always have a tin by you.

Obtainable from Garag's Cycle Stores, Ironmongers, Grocers.

In Tins, 4d., 8d., 1/9d.

Special quotations to Garages for "Gre-Solvent" in bulk

"Grip" most.

L. & K. PASTE SOLDER
Combined Solder and Flux.
Strength 50 to 60. In Tubes, self contained.
The simplest form of soldering.
A boon to the motorist—carry the tube in your pocket and make a good join on the road. Joins Bowden wires and nipples. No acids, flux, fire, or fumes required—squeeze out a little paste—apply the heat of a match or candle, and the repair is done. As supplied to H.M. Government.
Ready for instant use. Per tube, 2/6 post free.
Livermore & Knight, Ltd., 180, Fisel St., London

LAMPS

"1922"

MODEL

for 39/-

We have set aside 500 "1922" Streamline Lamp Sets and 500 Straight Horns to
 be sold, as an advertisement, at a big reduction in price. Your local garage will
 supply you—or, if desired, you can order direct, enclosing 1/6 extra for packing and
 postage. Take advantage of this offer NOW, and economise while you can. All
 orders will be executed in strict rotation. Export orders executed at same prices.

5" STREAMLINE Set 55/- less 13/- = 42/-

6" " " " 84/- " 25/- = 59/-

The F.R.S. Streamline is the set being chosen by all the best makers of motor cycles for equipping their
 machines complete. Its special features include: Patent door catch, which prevents door working
 loose, patent side sockets, and all straight arms. EVERYTHING made of BRASS.

12" STRAIGHT Horn 13/6 less 4/6 = 9/-

14 1/2" " " 22/6 " 5/- = 17/6

The F.R.S. new Straight Horn is quite original and superior—distinctive in tone and finish.

TRADE NOTE: A p.c. from garages interested will ensure a call from our district representative.

The Eve of the Show.

ONCE more we have arrived at the eve of the Show—the third since the war, and one which promises to be quite as interesting as any of its predecessors. To the student of design it may not contain so much material for debate, but it will reveal tendencies which are all to the good both from the buyers' and from the manufacturers' point of view.

Following closely the very successful automobile show, the motor cycle exhibition at Olympia is expected to excel all other similar shows in respect of the number of visitors who will daily throng to Kensington to examine the latest productions of the British, American, and Continental motor cycle industries.

Interest in motor cycles was never greater. It only requires an improvement in trade generally to increase the purchasing power of the middle classes, and the motor cycle movement will grow more rapidly than ever before. In other words, the recent depression in trade has been due to economic reasons only, and has no parallel in the history of industry.

In the early days of the motor cycle movement supply exceeded demand, because the number of persons interested in this type of vehicle was very limited. The reason further was that the motor cycle was a new method of transportation admitted to be in the experimental stage. To-day the motor cycle is as reliable as any other form of machinery, and the veriest novice, after learning the simple controls, may undertake a thousand miles journey with confidence. At one time it was necessary to be more or less a mechanic to obtain satisfactory results; to-day little more than the knowledge of driving is necessary. What is more, the general public now appreciate this. One no longer hears questions regarding reliability or otherwise of motor cycles; reliability is taken for granted, just as it is accepted by all in connection with cars. Thus, by trial and research,

manufacturers have removed the most adverse influence to sales which obtained in the past.

Motoring for All.

Most of the old points criticised a few years back have been eliminated. Mudguarding is much improved; both motor cycles and sidecars are comfortable. The chances of tyre trouble have been minimised by the general adoption of larger tyres. Increased knowledge in metallurgy has brought about refinements in design which a few years ago were impossible; it has also rendered possible the wonderful increase in engine efficiency, so apparent to all who have had opportunity to compare recent machines with those of only a few years ago.

Love of the open country is as great as it has ever been—the extraordinary popularity of the motor char-à-banc confirms this—and the motor cycle provides the most economical form of transportation for one person or a whole family, whether for pleasure or for business purposes.

Roads are returning to their pre-war standard and, so far as motor cycles are concerned, the value of the pound sterling shows a decided and welcome tendency in the same direction. In this connection, we are constrained to remind our readers that the 1922 prices of motor cycles compared with those prevailing in 1914 are remarkably low when the value of the pound is considered in connection with the purchase of any other commodity. There are very few articles which can be purchased below 100% increase on the pre-war price, yet 1922 motor cycles are, in many cases, quoted at figures considerably below the 100% increase standard. Only those who purchased motor cycles before the war can fully appreciate this. Prices, too, promise to be more stable, and there should not be any hesitancy on the part of would-be buyers to defer purchases from fear of high depreciation.

Everything considered, there is much to indicate that 1922 will be a far more successful year than at one time appeared likely.

Terminology.

THE secretary of the Croydon Foreign Language Club admits shortcomings in our mother tongue.

He quotes a common advertisement on French hoardings:

"Pneus Hutchinson, pour Auto, Moto, et Vélo."

This quite gets over the "pushbike" difficulty, doesn't it? But I must candidly warn my linguistic friend that willing as I am for my mount to be rechristened a "moto," I am quite sure he will never persuade the members of the North Road C.C. to allude to their dinky little speed-irons as "vélos." They are more likely to accept with glee such things as rear lamps and taxation! Time heals all wounds, and if my grandson follows in grandpa's footsteps, and perpetrates this column in A.D. 1975, he will probably be able to use the word "pushbike" without causing tanned gentlemen with exaggerated calves and large clubs to call at the office and ask if he is in.

The Tea-planter's Sidecar.

I SUPPOSE a certain percentage of our readers are tea-planters in embryo, and for their sakes I pass on a tip just to hand. Don't take out a car to a plantation—well, anywhere ending in "-addy" or "-ugger," without first seeking local information. My correspondent informs me that his rain book records 1.85 in., 4.45 in., and 1.17 in., for the last three days, and that his neighbourhood is simply studded with bogged cars, like the almonds on a sponge cake (pre-war model). He recommends a sidecar, because, when the worst comes to the worst, you can dissect a combination into its two main components, whereas a Rolls-Royce is by way of being an indivisible entity. In his part of the world the undershields of cars get so silted up with samples of road that there is no room left for the flywheel to revolve.

The Tink-a-Ponks.

I MUCH appreciate our correspondent's new name for the baby 'buses. We shall have to revise our opinion of the little 'uns. In the old days nobody could possibly regard them as a man's machine; they

were potterbuses, pure and simple. To-day, two varieties are quite assuredly good touring machines for moderately hard riders. One is the three-speeded baby two-stroke. I specify *three* speeds because no ordinary two-stroke possesses quite as good a range of engine revolutions as a decent four-stroke, and want of engine flexibility must be atoned for by plenty of gears. My own 2½ h.p. Cedros is a two-speeder, capable of about 45 m.p.h. on top, slowed on second gear by the need of a ratio which enables it to climb most things. Plus a rather higher top, a middle, appreciably higher than its present bottom, and a lower bottom, it would keep up a higher average, and become a positive dreadnought. The other sound touring model is a three-speeder four-stroke, fitted with some such engine as the 8,000 r.p.m. J.A.P. Of course, some of these babies are not sufficiently brilliant in design to be really comfortable—that is where the buyer must employ discrimination, for others hold the road like glue, and are not a bit dithey.

At any rate, engine and gear box design in the 250-350 c.c. class may be O.K.'d as being on sound go-anywhere lines, and some of the new frame layouts that are being readied for Olympia are miles ahead of 1920 designs. The methods whereby the engine and the gear box may be fitted *en bloc* take my eye mightily.

Are Journalists Handsome?

I AM deeply pained. I have had a most impertinent letter from a reader who has apparently

succeeded in penetrating my pseudonymity. He says he knows several other motoring scribes who, of recent years, have imitated my gay, irresponsible *causerie*, and they are—if possible—uglier than I am. He wants to know if there is any intrinsic connection between ugliness and contributing to the technical press.

Perhaps. A certain witty nobleman was once being chaffed about his somewhat uncouth personal appearance. "Ugly?" he thundered. "Of course I'm ugly. All intelligent men are ugly. Look at the bench of bishops." (*Then sotto voce*): "Aren't they handsome?" This letter reminds me that editors usually ask for portraits before granting interviews to aspirants to an editorial post.

A miniature reproduction of the coloured cover of our next week's issue, which will contain a full report of the Olympia Show.

Occasional Comments.—

The Poor Man's Motor Coach.

MOST impressive is the modern 5-8 h.p. family sidecar outfit—one of the commonest objects of the roadside, and may be termed Mr. Quiverful's joy. Mr. Quiverful is on the saddle, of course. Mrs. Quiverful occupies the central tier of the sidecar seats. In front of her (I never pried into their means of support) are the twins. Astern, in a kind of stern pocket corresponding to the dickey of a car, is little Tommy, not infrequently wedged in by Matilda; neither she nor Tommy can see anything which is not broadside on to them, for Mrs. Quiverful's material back makes an effectual windscreen. Mrs. Quiverful's sister occupies the carrier. It is because private owners subject innocent chassis to such terrific overloads that clubs have to include bad dreams like the Inverfarigaig hairpins in their competition routes. It is because of Mr. Quiverful and his like that sporting grass widowers like myself who want a sports solo have to put up with machines that weigh 240 lb. like the new o.h.v. Triumph. Ten years ago the Triumph people would have turned that bus out at 160 lb. Mr. Quiverful and his like have cured makers-of that. Bad cess to 'em.

Bone Lazy.

MY intimate friends always say that I was born tired. This is how they account for the fact that I take a far livelier interest in cycle cars than in sidecars. Perhaps it is so. There are days when our roads assume the consistency of the Passchendaele Ridge, and erupt a kind of gritty porridge on to their surfaces. It is possible that a cycle car brings home as much of this nauseous mire as any sidecar. But the gleanings are visible on the motor bicycle half of the outfit. It is more or less submerged in them. It is a long and grimy

business to remove them. On the other hand, a cycle car is enclosed in coachwork. The true function of coachwork, dear reader, is not to contain passengers. It is to conceal mud. I have the kind of mind which is worried by visible mud, but reckes nothing of invisible mud. So I frankly prefer the discreet and deceptive cycle car, which conceals its mud just as families secrete their skeletons in cupboards. I tell my friends who make sidecars that I will buy a sidecar outfit when ten minutes' business with a hose will render it ostensibly clean.

Seriously, though.

IT is easy enough to fling light persiflage at any type of passenger motor cycle, which after all is only the personification in metal of the poet's phrase My poverty, but not my will, consents.

Yet there is one solid fact to be urged in favour of sidecars, quite apart from all considerations of finance. What vehicle furnishes such real passenger comfort in all weather as a first-class sidecar, with suitable hood, screen, and other appurtenances? The Bedford cord cushions of a 40 h.p. saloon? Believe me, its springing is seldom as perfect as that of the best sidecars, and it fits you so loosely that you are jerked about by centrifugal force even if no actual jars reach you. In a good sidecar you float over the vilest pot-holes, and when the outfit swings its snug sides pinch you, and you swing in smooth harmony. Moreover, you do not feel as if you ought not to be in it. Occasionally one of my profiteer acquaintances (I do not know any lords) transports me in a £2,500 saloon, and I feel rather ashamed of sharing luxury when so many folk are unemployed. But a sidecar is comfort at a modest price, and Beery Bill, when he sights me, does not regard me as grinding the faces of the poor. So physically and morally and mentally the sidecar represents unalloyed comfort.

WITH THE AUTUMN GUNS.

Few of us live right on the top of a rabbit-haunted meadow, but many of us appreciate the thrill of a day's shooting. The sidecar solves the transport problem for all—not forgetting the dog.

AN OPEN LETTER TO THE TRADE.

The Economic Position. Catering for the Motor Cyclist of To-day and To-morrow.

GENTLEMEN,—By the Editor's courtesy it is my privilege to address you annually on the eve of the Show upon matters which are near both our hearts. This year I am inevitably reminded of a certain Oriental king, who slept badly after rather a damp evening. He dreamt. In his dream he saw seven hearty-looking cows feeding in a meadow. After a time seven skinny animals prowled into the meadow, "very ill-favoured and lean-fleshed"; but their appetites were certainly "O.K.," for they promptly gobbled up the seven fat cows. The king in question, like certain foreign princelings whom we wot of, was not a remarkably bright boy; so he sent for the business man of his empire, who immediately foretold a boom, to be shortly followed by a slump; and made provision accordingly.

Now you, gentlemen of the trade, are not a dreamy lot of people; in most of my dealings with you I have found you quite remarkably wide awake. Still, I believe you all dreamed this particular dream some time in November, 1918, and possibly you, too, saw seven fat cows, followed by seven ill-favoured beasts. The trouble is that only one fat cow came along. It was followed by one quite extraordinarily lean-fleshed and ill-favoured beast, which has gobbled up the fat cow, and is still as ill-favoured as it was at the beginning. Moreover, no man knows how many more of these lean-fleshed and ill-favoured beasts are coming along—the croakers expect a regular procession of them. So we are all rather sorry for ourselves.

We buyers and riders find time to be a little sympathetic with you sellers and makers, but we are much more sorry for ourselves. You, at any rate, had your one fat cow—in 1919 you could get any price for your machines that you liked to ask.

Both Sides of the Labour Question.

If you are not tired of parables, I may be bold enough to indicate the best way of showing the lean cows out of the meadow. In pre-war days I once employed a bricklayer to put up a garage, and he laid over 700 bricks in the day, by which he earned, if I remember aright, about 7s. After the war some of us converted an Army hut into a village club. The job entailed the laying of 1,200 bricks, and the wage bill for bricklaying alone amounted to over £20. When a labourer will not labour, costs go up; when costs go up, export trade disappears in competition with countries where labour does labour. Some people pause and fulminate at this point of the enquiry, others go on to ask why labour will not labour.

Some years ago I got a young married mechanic a job in the cycle trade at Coventry. He was a steady, hardworking young fellow, and had spent all his savings in furnishing. In his first year at Coventry he was never technically unemployed, but he only got 150 days' work, and he was only paid 150 days' wages. Labour not unnaturally desires security. When labour finds that there is not enough work to give every man 286 days' work in the year, it invents dodges for distributing the job and the wage as evenly as possible; and the remedy is often as bad as the disease. That is the problem which we have to solve before whole-hearted co-operation between employer and employee can return. Let us hope it will return rapidly, and restore our lost export trade.

Competitions Still Booming.

Leaving these dismal matters on one side, we have had a great season in spite of the slump. A record addition of riders to our ranks. Plenty of clean, wholesome sport in our competitions. Lots of new reputations made. Few old reputations smirched. We shall return to the struggle in 1922 with renewed ardour—the T.T. in particular is going to be a battle in which no quarter is asked or given, and I don't think anybody is really sorry that in all probability we shall revisit the Isle of Man again, even though a race in Belgium might have stirred our lethargic Parliament to picture a race somewhere in the centre of England.

I daresay you have noticed a most profound and subtle change which is stealing over the motor cycle world. Before the war, motor cycling was sport. To-day it is transport. I don't say that the sporting type of rider is extinct; it is still every boy's dream that papa will remember his birthday with something which has short flat handle-bars and an exhaust pipe like a stove funnel. But just as the pedal cycle began by being a society toy, and eventually economised the rural postman's shoe leather, so the motor cycle is now regarded, like the doormat, as an essential and unromantic part of many people's existence. Gone for ever are the days in which most riders treated the machine as a collector treats a precious *objet d'art*. It isn't the pivot round which our lives revolve. We don't gallop home from the office to clean it. No! Most of us ride it in a sober, businesslike fashion, cuss it when necessary, and forget all about it between whiles. Now there are essential differences between an idol and a doormat. Men don't object to devoting much time and cash and thought to their

An Open Letter to the Trade—

gods. But they expect a doormat to function automatically and without attention.

It follows that the motor cycle of to-day and to-morrow should be an entirely different proposition from the motor cycle of yesterday. Terrific speed no longer matters. Climbing should be sure rather than breath-catching. A glittering appearance is quite unnecessary. On the other hand, the machine should weigh as little as may be. It should float over the vilest surfaces. It should start at a nod of the owner's head. It should cost a mere trifle to maintain. It should never require any cleaning. It should stand up by itself on the least provocation. It should not compel you to dress as if you were trying to break the altitude record with an aeroplane. It should lend itself to transporting the modest baggage which cyclist travellers need, from a pound of tomatoes up to eight stone of female beauty. It should be skidproof. It should never, never, never develop fits of the sulks on a wet night. Its oil should be out of sight and out of mind. It should never confront its user with the highly expert task of mending a tyre in the cold dark on his way to keep a vital appointment. It should not make noises like a machine gun.

It is a slow job to convince John Citizen in his millions that you make the best utility machine on earth. On the other hand, you can earn a colossal reputation in three months by winning the T.T. But if you specialise on the sports side of the industry, its far more important utility aspects are apt to get obscured, both in your own mind and in your drawing office. No man can serve two masters.

Towards New Ideals.

Besides all this, the utility aspect bristles with barbed wire. How to lighten the machine? How to weatherproof it? How to spring it? How to make it punctureproof? How to cut down running costs? None of these problems are easily solved. Still, behind all the speed and stunt work most of you are busily working towards the new ideals. Quite a lot of standard $3\frac{1}{2}$ h.p. machines will do their 100 miles on a gallon of petrol, and their 1,500 miles on a gallon of oil. The new super saddles save our spines many a jar. The 3in. tyres which are gradually invading the smaller classes add to our comfort, and often run a whole season without deflation. Crank cases are growing "cleaner." Automatic oiling is slowly gaining ground. Nickel plating is shrinking annually in area. Weight is coming off here and there, though not half fast enough. The A.C.U. Six Days Trials were a clean break with the riotous tests of the past, though they largely failed to differentiate the best machines from the not-so-goods. John Citizen is still seriously scared when he chances to witness one of our motor cycle competitions, but he is, nevertheless, coming over to us in large numbers; and in another year we shall understand more clearly what this worthy gentleman wants.

It is quite possible that the sidecar is the real pointer towards the future of the industry. The extraordinary achievement of F. C. North's O.K. outfit

shares with the $2\frac{3}{4}$ h.p. A.J.S. victories the chief sensations of the year. Now John Citizen has limited use for a solo mount. He is as sociable as he is timid. A sidecar will accommodate Mrs. Citizen and some of the olive branches; moreover, it will not fall over on grease, and it does not want holding up or propping when it is blocked in traffic or happens to be dismounted. So John seldom remains content with two wheels. If we get any poorer than we are now, the single-cylinder sidecar outfit is going to be the maximum most motor cyclists will consider. Then we shall get down to the sidecar, which would, at the worst, transport two or three people cheaply over easy roads. Given moderate prosperity, the 4 h.p. proposition will be the best seller. For a year or two something good and cheap to carry two people is what is most wanted. That is why the pillion seat survives so doggedly. It may not be too safe on the novice's machine, it may never be cosy, but it gets there, and the extra seat costs no more in taxation.

Expensive Electric Lighting.

It is very unfortunate that electric lighting should have become really sound just when few of us can afford £30 extras, for electric lighting is almost a necessity on a utility machine. Perhaps the dissolved acetylene people will seize their chance. We all want electric lighting, but only a limited number are going to pay £30 for it. Nothing so reconciles a man to all-weather motor cycling as the knowledge that he can rely on first-class lighting with the minimum of trouble. A word of commendation is therefore due to those who have evolved, or are attempting to evolve, a simple combined lighting and ignition set suitable in weight and cost for the very lightest machines.

Our current impoverishment leads to cheaper machines. But there are many ways of cutting prices. Designing for production is the road to fame and riches. Reducing quality is the road to bankruptcy. The utility mount must be reliable first, last, and all the time.

Perhaps we ought all to give a thought to the immense number of roadworthy motor cycles which are now in owners' hands. There are over 370,000 machines licensed in this country. The vast majority are still eminently rideable. Only a percentage of their owners will buy new machines until general trade revives. We have to break new ground to find big 1922 markets. The good sign, however, is that there is no lack of interest in motor cycles, and the desire to possess a new model is as keen as ever. Another cheery note is that we have the strong pull of economy, for no form of transport is so cheap and reliable as a good motor cycle. Those who spend their Bank holidays and their summer vacation a'wheel know it too.

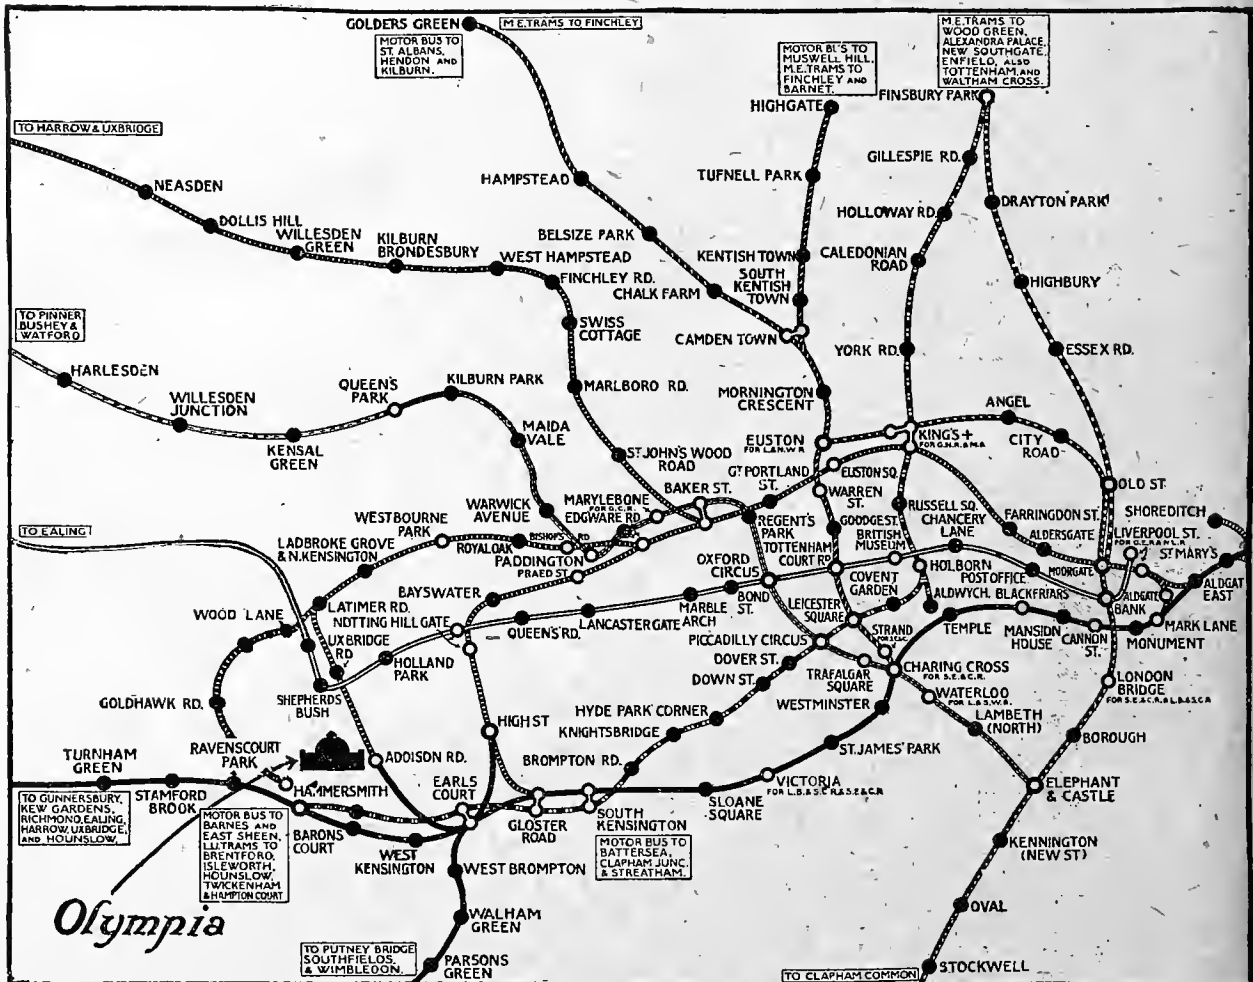

I fervently hope, gentlemen, that before another Show comes round we shall have got our house in order, so that the unsurpassable quality of British motor cycles will again reap its due reward on the international markets, and so create increased prosperity at home.

Yours very sympathetically,

B. H. DAVIES.

HOW TO REACH OLYMPIA.

Connections of the Underground System with the Main Lines shown by Map and Table.

FOR those who do not know their way about London the following information will be of service. The map, in conjunction with the table, shows how Olympia may be reached by underground railway, or by motor omnibus, from the principal termini, as well as the Tube routes from all parts of the London area.

BAKER STREET (Metropolitan Ry.). By Metropolitan Railway to Addison Road.

BROAD STREET (L. & N.W. Ry.). By Central London Railway to Shepherd's Bush, changing there to motor 'bus—Nos. 49, 49a, or 49b.

CANNON STREET (S.E. & C. Ry.). By District Railway to Addison Road, changing at Earl's Court.

CHARING CROSS (S.E. & C. Ry.). By District Railway to Addison Road, changing at Earl's Court.

EUSTON (L. & N.W. Ry.). By Hampstead line to Charing Cross, thence by District Railway to Addison Road, changing at Earl's Court; or by L. and N.W. Railway to Addison Road, changing at Willesden.

FENCHURCH STREET (L.T. & S. & G.E. Ry.). By District Railway from Mark Lane (3 minutes' walk) to Addison Road, changing at Earl's Court.

KING'S CROSS (G.N. Ry.). By Piccadilly line to Addison Road, changing to District Railway at Earl's Court.

LIVERPOOL STREET (G.E. Ry.). By Central London Railway to Shepherd's Bush, changing there to motor 'bus—Nos. 49, 49a, or 49b.

LONDON BRIDGE (L.B. & S.C. & S.E. & C. Ry.). By District Railway from Monument Station to Addison Road, changing at Earl's Court.

MARYLEBONE (G.C. Ry.). By Metropolitan Railway from Baker Street to Addison Road.

PADDINGTON (G.W. Ry.). By Metropolitan Railway to Addison Road.

ST. PANCRAS (M. Ry.). By Piccadilly line to Addison Road, changing at Earl's Court.

ST. PAUL'S (S.E. & C. Ry.). By District Railway from Blackfriars Station to Addison Road, changing at Earl's Court.

VICTORIA (L.B. & S.C. & S.E. & C. Ry.). By District Railway to Addison Road, changing at Earl's Court.

WATERLOO (L. & S.W. Ry.). By Bakerloo line to Charing Cross, thence by District Railway to Addison Road, changing at Earl's Court.

'Bus Routes to Olympia.

For those who prefer to travel all the way to Olympia by motor 'bus, the following particulars of the services available should be studied:

BAKER STREET (Metropolitan Ry.). 'Bus service Nos. 27, 27a, or 27b.

BROAD STREET (L. & N.W. Ry.). No. 9.

CHARING CROSS (S.E. & C. Ry.). No. 9 or No. 33.

CANNON STREET (S.E. & C. Ry.). No. 1 to Piccadilly Circus, thence by No. 9 or No. 33.

EUSTON (L. & N.W. Ry.). No. 73.

FENCHURCH STREET (L.T. & S. & G.E. Ry.). No. 23 to Oxford Circus, thence by No. 73.

KING'S CROSS (G.N. Ry.). No. 73.

LIVERPOOL STREET (G.E. Ry.). No. 9.

LONDON BRIDGE (L.B. & S.C. & S.E. & C. Ry.). No. 13 to Piccadilly Circus, thence by No. 9 or No. 33.

MARYLEBONE (G.C. Ry.). Nos. 27, 27a, or 27b.

PADDINGTON (G.W. Ry.). Nos. 27, 27a, or 27b.

ST. PANCRAS (M. Ry.). No. 73.

ST. PAUL'S (S.E. & C. Ry.). No. 9 from Ludgate Circus.

VICTORIA (L.B. & S.C. & S.E. & C. Ry.). Nos. 16, 25, 25a, 25b, 38, 38b, to Hyde Park Corner, then by No. 9, 33, or 73.

WATERLOO (L. & S.W. Ry.). Nos. 1a, 6, 6a, 6b, to Strand, thence by No. 9.

HOUSLOW. No. 37 to Richmond, thence by No. 33, 73, or 27.

LEWISHAM. Motor 'bus No. 49a runs Shepherd's Bush via Holland Road, serving also Catford, Forest Hill, Upper Sydenham, Crystal Palace, Beulah Hill, Streatham Common, Tooting Bec Road, Trinity Road, Northcote Road, Falcon Road, Battersea Bridge, Sydney Street, Gloucester Road, and High Street Kensington.

An Advance Review of 1922 Motor Cycles, Sidecars, and Runabouts to be Exhibited at the Motor Cycle Show opening on Monday Next.

The following pages contain a stand-to-stand forecast of the exhibits, so arranged as to form a guide to the Show. Also in this issue will be found plans showing the positions of exhibitors.

In addition to the forecast of 1922 models contained in this issue, "The Motor Cycle" for several weeks past has contained detail descriptions of new machines. The issues in which these appeared were as follows:

Ariel Nov. 17	Francis-Barnett . Nov. 3	Matchless Oct. 6	O.K. Oct. 27	Sirrah Oct. 27
Bradbury Nov. 17	Hazlewood Nov. 3	and Nov. 17	P. & M. Oct. 27	Sunbeam Nov. 10
Beardmore- Precision Nov. 10	Humber Oct. 12	Mackechmie Nov. 10	Quadrant Nov. 17	Sparkbrook Oct. 27
Bown Nov. 3	Harley-Davidson . Nov. 17	Metro-Tyler Nov. 17	Rudge Nov. 17	Triumph Oct. 27
Coulson Nov. 17	Hawker Nov. 17	New Comet Oct. 27	Raleigh Sept. 22	Verus Oct. 27
Coventry-Victor . Nov. 10	Indian Nov. 17	New Imperial ... Nov. 3	Royal Ruby ... Nov. 10	Velocette Nov. 3
Douglas Oct. 27	Ivy Oct. 27	New Hudson Nov. 3	Radco Nov. 10	Victoria Nov. 17
F.N. Nov. 17	James Oct. 20	N.U.T. Nov. 17	Rex-Acme Oct. 13	Wolf Oct. 27
	Levis Oct. 27	Omega Nov. 10		

Stand

HAGG.

3. The Hagg has now fully passed its experimental stage. The mechanism is almost entirely enclosed by means of aluminium plates, which not only serve to enclose the moving parts, but act as

The adjustable rear seat of the Hagg tandem.

efficient windshields. Pressed steel enters largely into the construction and is employed in the tank, rear forks, and rear mudguards, which enclose a very large portion of the back wheel. The frame, incorporating the engine cradle, gear box carrier, and under shield, is made of heavy tubing, while the rear wheel is sprung by means of a single leaf spring.

The engine is a 350 c.c. Precision two-stroke, driving through a foot-operated

Burman two-speed gear box. The engine is started by hand by means of a long lever attached to the usual kick-starter spindle. The Hagg may be used not only as a solo mount but as a tandem, the passenger being carried on an aluminium bucket seat sliding in grooves attached to the valances of the pressed steel rear mudguard. A low centre of gravity should ensure absence of skidding.

Stand

X.L.

3. Among the lesser known, but none the less deserving, makes, the X.L. will merit careful study when on view at Olympia. The frame is of unusual construction, in that the bottom back stays

are extended forward to meet the front down tube lug, so making the construction a rigid one, without depending upon the engine crank case, which is held by separate bearers. Pressed steel lugs are employed throughout. The motive power is the new pattern 4 h.p. J.A.P. engine, 85x95 mm. (550 c.c.), and the gear box is a Sturmey-Archer. A saddle of the firm's own construction hinged at the peak, and made under Lycett's patents, is used. Hinged front forks are fitted; and both front and rear mudguards are most efficient.

A mount of graceful appearance—the X.L., noticeable, too, for its excellent mudguarding.

Forecast and Guide to Olympia.—

Stand

P.V.

17. One of the earliest successful spring frames, the P.V. design, remains as neat as any on the market. Yet it has not been altered to any great extent in recent years, which is testimony to the original excellence of the layout. The system is simple. The short pivoting forks upon which the rear wheel is carried are extended forward, being controlled by concealed shock and rebound springs in the suitably curved saddle tube. A Villiers-engined lightweight is probably the best known P.V., but the frame has also been found to be eminently satisfactory in a J.A.P.-engined twin 4 h.p. model.

Stand

READING-STANDARD.

18. "Oversize" V twins are fairly popular in America, but, so far, the only one that has gained any hold on the

Following conventional design this Ready model will appeal to followers of the four-stroke lightweight type of mount.

British market is the Reading-Standard. It has an engine of 1,280 c.c., and, in one or two respects, is not quite so strikingly "American" as its compatriots from across the Atlantic. Side-by-side valves are standard, and a transmission shock absorber may be fitted, if desired, at a slight extra cost. Twist grip control and a commendably deep and capacious petrol tank form unmistakable clues to its nationality. Wide mudguards of clean contour and enclosed valve springs are two admirable points in the design. Dynamo lighting may be fitted at the option of the purchaser.

Stand

READY.

18a. The 'Ready' is a production from Weston-super-Mare, and a newcomer to Olympia. Four models will be exhibited, representative of the range of seven machines to be offered in 1922. Two of the motor cycles staged will have 292 c.c. J.A.P. engines, Burman two-speed gears, one having a clutch and kick-starter. A 350 c.c. J.A.P. engine forms the power unit of the third

A 4 h.p. dual purpose mount—the P.V., fitted with a rear-springing system that has stood the test of several years' experience.

Among the many novel features of the Hagg motor cycle, the pressed steel rear forks call for notice.

model, and the gear box is of the three-speed type with clutch and kick-starter. The fourth model has a Coventry Victor flat twin engine, and is intended for side-car work. The silencing arrangements on all these motor cycles are well worth noting. At first sight it appears that plain exhaust pipes without expansion boxes are fitted, but on examination it will be found that neat detachable silencers are contained in the ends of the pipes.

Stand

GRIGG.

19. The chief feature of the Grigg exhibit will be the 1½ h.p. ultra lightweight two-stroke with duplex frame, which is described elsewhere in this issue. It is a fascinating little mount, which must make a strong appeal to ladies especially, while those well past their youth will find in it a type of machine for which so many have been waiting.

Engined with the same diminutive power unit, the seat-type scooter is also

Engine side of the Grigg miniature; the drive is by chain to the gear box, and thence by belt to the rear wheel

an attractive production for those desiring this type of vehicle.

Stand

COTTON.

20. Motor cyclists who have studied triangulated frame design, and those who favour weight reduction, will find the Cotton exhibit of great interest. The Cotton frame is of the duplex-type, and none but straight tubes are used in its construction. It is not a new idea, for the Cotton frame has had a successful existence since pre-war days.

Stand

POWELL.

21. A Wrexham production, the Powell is one of the post-war designs. It has a 4 h.p. four-stroke outside fly-

Forecast and Guide to Olympia.—

wheel single-cylinder engine placed in an inclined position in the frame. For 1922 several alterations have been made, including a re-designed timing gear which now has separate cam wheels instead of both cams being on one camshaft. Chain drive will be introduced in place of the chain-cum-belt transmission hitherto used.

Stand

QUADRANT.

22. Bearing an honoured name in the motor cycle world, the Quadrant is again offered at a very low price. Equipped with a Quadrant 4½ h.p. four-stroke engine, and fitted with a Sturmey three-speed gear and chain drive with shock absorber, the Quadrant sidecar outfit is to be sold at £105. An alternative model with chain-cum-belt transmission is £5 less. It is an exceedingly neat outfit, well made, and cleanly designed. The tank is of the saddle type, has rounded sides, and the mud-guarding is well carried out.

An inclined cylinder is a feature of the outside flywheel Powell engine.

Stand

UNIBUS.

23. Visitors to Olympia who regard shaft transmission as the ideal for motor cycles will pause long at the stand of the Gloucestershire Aircraft Co. to examine the Unibus miniature; it is an excellent example of the manner in which shaft drive can be applied to a single track machine. The Unibus is excellently made, and, had the same mechanical principles been applied to a larger machine more on motor cycle lines, there is no doubt that such a machine would have taken its proper place among the post-war designs. As an elaborate form of "scooter," it represents the last word in this type of machine.

Stand

SIDECAR BODY CO.

24. A wide range of sidecars, marketed under the general name of Rideezi, will be shown by the Sidecar Body Co. The Show exhibits will range from large double-seated sidecars to the inevitable sporting models of projectile shape in

Of substantial construction and pleasing in design—the 10 h.p. Castle Three runabout.

polished aluminium. Touring sidecars for low, medium, and high-powered machines are to be shown. A feature of all the Rideezi sidecars is that they are built throughout in the works of the makers, even the lugs and fittings being machined under personal supervision.

Stand

HAWKER.

25. Next year the Hawker two-stroke will not stand alone as a two-speed light-

ing the same general lines, however, a range of Blackburne-engined machines has been introduced, including 2½ and 4 h.p. types, and also the new 2½ h.p. overhead valve model. Burman gear boxes are fitted to the heavier Hawkers.

Stand

CASTLE THREE.

26. Except that it has but three wheels, the Castle Three is a small car of quite elaborate design and large engine capacity even for the corresponding four-wheeler class. It weighs 10 cwt., and has a four-

Except in very minor details the two-stroke Hawker, which has done well in this year's trials, has not been altered.

weight of extremely simple design; several firms are following similar lines in their 1922 models. But the Hawker remains distinctive in several ways—the saddle, for example, and the cylindrical metal tool-box, which is a replica of the silencer. Only in finish has this model been improved for next year. Follow-

cylinder water-cooled engine of 1,207 c.c. (nominally 10 h.p.). Although car practice is again followed in the drive (by shaft), the gear box is of the epicyclic type. A reverse is provided. The bodywork and general finish are most attractive. Transverse quarter-elliptic springs are used in front, while 40in. long semi-

A £105 4½ h.p. outfit—the Quadrant.

Forecast and Guide to Olympia.—

A Francis-Barnett Sports model fitted with 2 1/2 h.p. J.A.P. engine.

elliptics support the rear wheel. All three wheels are interchangeable, and special provision has been made to ensure quick detachability of the rear.

Stand

GRINDLAY SIDECARS.

27. The Grindlay name was built up on the success of an admirably sprung chassis, which embodied a floating hub spindle carried between two half-elliptic springs; these, with their front anchorage and back shackle, form an enclosing rectangle about the wheel. Such a successful design naturally is still prominent in the firm's programme, but the demand for lighter and cheaper chassis for use with less powerful and heavy machines has resulted in the inclusion of a very simple rigid wheel chassis, carrying a body of the sporting

weight three-speed Sturmey gear box, the operating lever of which is mounted on the bottom bracket and held down by the gear box fixing nuts. Thus the control rod is not disturbed by adjustment of the primary chain. Incidentally, this latter process is effected by the now popular "eccentric" method. The Francis-Barnett saddle tank is naturally

A tubular chassis, cantilever rear springing, shaft drive throughout, and a water-cooled V-type engine are characteristics of the T.B. three-wheeler.

For solo or sidecar service—the 686 c.c. flat twin Coventry Victor.

variety. A very graceful semi-sports body is also mounted on a spring wheel chassis forming the Club model, and most attractive it looks.

Previously, the luxurious *de luxe* models had coil springs to support the toe of the body, but now upturned quarter-elliptics are used. At the back are also quarter-elliptics, the free ends of which slide in special lugs on the chassis cross members.

Stand

FRANCIS-BARNETT.

28. There are several lightweight models with a very similar general specification to the Francis-Barnett, but careful detail design gives it a surprising amount of distinction. This is particularly true of the new 350 c.c. sporting model, which has as a power unit the remarkably efficient little J.A.P. engine of that capacity. Transmission is by chain through a light-

fitted, but it is now enamelled black, as are as many hitherto plated parts as possible. Other models include a two-stroke and a 293 c.c. J.A.P.-engined utility mount, both with two-speed Sturmey-Archer gear boxes. Legshields and a Maglita may be fitted to the 293 c.c. model if desired. All three machines are excellently finished.

Stand

T.B.

29. The T.B. belongs to the heavier class of three-wheeler, and has a car-type gear box giving three speeds and reverse; the final drive is by shaft. A choice of J.A.P. engines, however, is allowed, ranging from the water-cooled 10 h.p. type down to the air-cooled 986 c.c. model (nominally 8 h.p.). None of the T.B. three-wheelers, however, exceed 8 cwt. in weight, and thus they come into the £4 class for taxation. An enormously strong chassis or frame is the chief feature of this machine, but the geared-up starting handle and the telescopic steering column

are also worthy of mention. The rear wheel is quickly detachable, and all three are interchangeable.

Stand

DOT.

30. A new spring frame of duplex construction is one of the Dot features for 1922. The principle adopted embodies a rear wheel frame hinged near the gear box, and connected to the upper part of the main frame by means of coil springs. The hinged member is carried on ball bearings. Both engine and gear unit are carried inside the frame. Two 8 h.p. outfits are to be offered, one being a "sports" model.

Stand

SILVER PRINCE.

31. Although a newcomer to Olympia, the Silver Prince motor cycle is not an entirely new machine. Illustrations of the current year's models have already

This utility model of the Silver Prince two-stroke is named the Indian Prince

Forecast and Guide to Olympia.—

An alteration immediately noticeable on the 1922 flat twin Harley-Davidson is the substitution of a chain guard for the case previously used.

staged at Olympia in an unfamiliar shade of dark green. Mechanically, however, little change will be noticeable. The 4 h.p. flat twin, which has a primary gear drive, will now have a light guard protecting the rear chain instead of the

Velocette has been further improved for next year. The gear box has been redesigned, and is now obtainable in two or three-speed forms with both clutch and kick-starter, which latter fitting, by the way, does not necessitate an extra pinion. Gear control is now effected by a conventional type of gate; a more efficient silencer with an ejector action, and neater and more easily detached chain guards are also among the alterations. Provision has also been made to exclude oil from the rear brake (of the internal expanding type); and throughout the machine grease cups replace the pedal cycle type of lubricator wherever possible. Finally the front forks have been strengthened, and both front and rear mudguards extended. The Velocette self-contained, mechanical lubrication system has, of course, been retained; and, indeed, the power unit generally has not demanded change. Only one size and type of engine is made by this firm.

Stand

RADCO.

37. A feature of the Radco exhibit will be a neat little machine especially manufactured for riders of the fair sex. The weight will be no more than 150 lb., and it will have a very low saddle position. 24x2in. tyres are used, and special quickly detachable dressguards are fitted. In common with other models, the 2½ h.p. Radco two-stroke engine (67x70 mm. bore and stroke = 247 c.c.) is used. This engine is some-

complete case hitherto fitted. Mechanical pump lubrication, twist grip control, and 28x3in. tyres, and the like distinctive features of an American machine are retained. The popular "seven-nine" for 1922 mainly differs from the 1921 model in electrical details; a new ammeter and switch box are fitted on the top tube. With a suitable sidecar the big twin Harley-Davidson is one of the fastest passenger three-

A lightweight for ladies—the 2½ h.p. Radco.

wheelers on the road, while it makes a suitable solo mount for certain enthusiastic types of solo motor cyclists.

Stand

VELOCETTE.

36. Although it is already undoubtedly one of the most successful lightweights on the road, the 2½ h.p.

what larger than that used in previous models, though it retains most of the original features. Amongst other details are the neatly enclosed exhaust release leading to the exhaust port. Several variations on the standard machine are available, and single geared, two-speed, and two-speed with clutch and kick-starter are made. In addition, a light sidecar outfit with three-speed gear may be shown.

Stand

NEW HUDSON.

38. From the neat little New Hudson two-stroke to the beautifully equipped three-wheeler is a large gap, but this is bridged by the new big single sidecar outfit. With all-chain drive and Sturmey-Archer gear, footboards, and legshields, and a very full equipment, this will be one of the most attractive bargains for the buyer who desires a useful sidecar mount, selling, as it does, at a very moderate figure. The New Hudson three-wheeler has undergone several important modifications, and is now fitted with the 10 h.p. water-cooled M.A.G. engine.

A three-wheeler of exceptional finish—the New Hudson.

Forecast and Guide to Olympia.—

Very careful consideration has been given to the detail work of the 4½ h.p. New Hudson.

Visitors should not fail to see the very neat and simple permanent jack which is used to facilitate the removal of the rear wheel. Three speeds and reverse and shaft and chain drive are features of this luxurious runabout. The little two-stroke is too well known to need description, and it is sufficient to state that a *de luxe* model with all-chain drive is now marketed as well as the popular lightweight.

Stand

LEA-FRANCIS.

39. Noted for the excellence of the detail work and finish, Lea-Francis, Ltd., have not found it necessary to make any radical alteration in their 3½ and 5 h.p. twin-cylinder models. The only modification of note lies in the fact that on the larger machine the clutch and shock absorber are now fitted on the countershaft instead of on the engine-shaft. A Brampton spring link chain is also fitted as a final drive on the 5 h.p. model. It will be remembered that, though a normal type of gear box is employed on the passenger machine, on the smaller mount the gear unit is housed in a cylindrical bottom bracket with a simple eccentric chain adjustment. M.A.G. engines are fitted in both cases.

Stand

WATSONIAN SIDECARS.

40. Watsonian Sidecars, of Conybere Street, Birmingham, are putting forward several new models which will be staged at the Show. Two of special interest are the commercial box carrier, mounted on a triangulated chassis,

and capable of dealing with loads up to 3 cwt., and the truck sidecar, with a float type of body, suitable for farmers, builders, plumbers, or similar tradesmen. The truck body will accommodate two standard milk churns, and its strength (the construction is of oak, reinforced with iron plates) permits it to be used for small livestock or any heavy or rough load.

Improved appearance is a characteristic of the new 8 h.p. o.h.v. F.N.

Amongst the touring Watsonian models may be mentioned the new Featherweight A. This is a streamlined body of polished aluminium on a very light triangular chassis. The price is very low, almost at pre-war level, and the appearance is attractive. The total weight of this sidecar is 60 lb. A more ambitious

A useful type of mount for serious sidecar work: The Abingdon 6-7 h.p. twin with three-speed gear.

sporting model, is the R34, built on "airship" lines; while the Monarch is a large and roomy touring sidecar with ample locker space, yet it is comparatively light withal, its weight being 111 lb.

Stand

F.N.

41. The new 8 h.p. F.N. will undoubtedly be one of the attractions at the forthcoming Exhibition. There have been few alterations since 1914, but the 1921 model will be a thoroughly up-to-date machine, having overhead inlet valves in the four-cylinder engine placed centrally in the cylinder heads similar to those of the 1914 T.T. model. The single-cylinder lightweight will also have an overhead inlet valve.

The exhibit will consist of four standard 2½ h.p. lightweights, two 7 h.p. four-cylinder motor bicycles, and two 7 h.p. four-cylinder motor bicycles (of which one will be fitted with the F.N. standard sidecar complete with hood and screen, while the other will be equipped with a special limousette sidecar with V pattern windscreen). Two of the new 8 h.p. four-cylinders will be shown—one with and one without sidecar—and one 2½ h.p. lightweight with overhead inlet valve.

Stand

ABINGDON.

42. A 3½ h.p. sports model Abingdon, with Maplestone forks and direct belt

drive, in conjunction with an adjustable pulley, will be shown. A similar machine with three-speed gear and chain and belt drive makes a useful dual-purpose mount, while the 6-7 h.p. twin, fitted with all chain drive and 28×3in. tyres is a fine heavy passenger job. A novelty, however, will be the big 4½ h.p. single, 85×110 mm. bore and stroke (624 c.c.). This machine is specially built to meet the demand for a robust and simple sidecar machine, and we are in a position to state—after a trial run—that the pulling powers of the new engine are excellent. Fitted with three-speed gear and all chain drive, the big single Abingdon will make a strong appeal to a large class of buyers, to whom the name of the manufacturer is sufficient guarantee of sound construction. 28×3in. tyres are also fitted to this model.

Stand

B.S.A.

43. Besides the well-known single cylinder B.S.A., which is one of the most popular dual-purpose machines on the road, there will be three other models exhibited. First the sports model, which is a replica of the standard machine.

Forecast and Guide to Olympia.—

The new "light six" B.S.A. which resembles the former 6 h.p. model excepting that the frame is of lighter construction.

minus all but the essential fittings, and having a specially tuned engine; next the "light six," which has the existing 6 h.p. engine mounted in a light frame, and is suitable either for fast solo or sidecar work; and lastly the 8 h.p. twin, which is designed particularly for heavy sidecar work. With its all-chain drive enclosed in cast aluminium cases, its three brakes, and interchangeable wheels, the 8 h.p. B.S.A. is a fine example of the British big twin. No effort has been spared to make a sidecar roomy and luxurious and a machine capable of towing a heavy load wherever wheel grip can be obtained. The B.S.A. oscillating oil pump is worthy of special attention; it has given every satisfaction during 1921.

Inverted semi-elliptic rear springing on the new Triumph sidecar.

The marketing of this overhead valved machine as a sporting model marks a big departure for the Triumph manufacturers.

Stand

KENILWORTH.

45. A clutch on the countershaft is the chief addition to the now well-known Kenilworth miniature—a type of machine often mis-called a scooter. The four-stroke overhead valve engine is retained, and detail improvements have been embodied as a result of another twelve months on the road. For the lady who has had no previous experience with motor cycles, and who wishes to substitute a petrol-driven vehicle for her pedal cycle, the little mount is eminently suitable. It is extremely easy to wheel about and to start at walking pace, and the new clutch should facilitate this.

Stand

NER-A-CAR.

46. Although the manufacturers of the Ner-a-car insist that their production is *not* a motor cycle, it will be shown at the motor cycle exhibition, where no doubt it will attract considerable attention. It is a very unconventional form of vehicle. A two-stroke single-cylinder engine is set across a pressed steel frame, and drives to the back wheel through friction discs and a final chain. No front forks are employed, the front wheel being supported centrally within the hub, and the steering column is connected to the wheel by means of a short arm and tie-rod following motor car lines. Everything except the cylinder is entirely enclosed. There is ample protection for the rider, and the mudguarding is excel-

TRIUMPH.

44. Triumph motor cycles are so widely known that little need be said concerning the exhibit on this stand. Being a new model, and probably the only four-valve single in the Show, the 3½ h.p. sporting mount, however, deserves attention. The o.h.v. engine fitted to this machine is of Ricardo design, but manufactured by the Triumph Co. in its usual "finished" way. It also differs from the great majority of sporting mounts in the fact that it is not purely a racing production; 26×3in. tyres are fitted, and the transmission and gear box are the same as used on the familiar 4 h.p. model (chain-driven). Mainly unaltered, the latter machine will

An unconventional machine known as the Ner-a-car. The engine is a two-stroke of 211 c.c. capacity.

Forecast and Guide to Olympia.

lent. The front mudguard does not move with the wheel, but is so wide as to cover it through its somewhat limited "lock." It will be remembered that this machine has successfully accomplished a thousand miles A.C.U. officially observed trial in the hands of a lady driver.

Stand**MARTINSYDE.**

47. The engine units of the Martinsyde machines are unique in having the valves disposed so that the exhaust is overhead and immediately above the inlet valve, which is in a normal position at the side of the cylinder; this arrangement does much to keep the cooling of the head reasonably even, so avoiding distortion. In detail the 6 h.p. sidecar outfit has been improved, especially as regards the interchangeable wheels, brakework, and the sidecar. The $3\frac{1}{2}$ h.p. twin sports solo model will, of course, be shown. Further reference to Martinsyde improvements and alterations for next year will be found on another page of this issue.

Stand**OMEGA.**

54. Apart from their standard models, the makers of the Omega are introducing one of the few novelties of the Show, and undoubtedly the centre of attraction on their stand will be the new duplex frame two-stroke. A 350 c.c. two-stroke engine, with a well-finned cylinder, is built up as a unit with a three-speed gear box, clutch, and kick-starter, and aluminium footplates. This unit is carried in a very wide duplex frame, and is quickly detachable therefrom. The saddle position is very low, and the mudguarding and leg screens are excellent. Alternative final drive and two or three-speed gear boxes are offered, and the method of holding the tank against the top tube by plates and jack screws should be studied, as it offers a fresh solution to the question of tank fixings without rattle. Examples of one or two of the other Omega models will also be shown.

An interesting addition to the Omega range; the power unit and footboards are inside the duplex frame.

Stand**MONTGOMERY SIDECARS.**

55. To sum up in a few words the range of sidecars to be exhibited by Montgomery, of Coventry, is almost an impossibility.

Pride of place, perhaps, should be given to the sporting model, a sidecar of the hammock seat variety, with bodywork on most graceful and racy lines, and a chassis of ample strength for attachment to the fastest of 8 h.p. "hog-buses," and yet of the lightness demanded by the owner of a $3\frac{1}{2}$ h.p. single.

For lightweights of low capacity is a new lightweight model in which the chassis is "cut" to the ultimate minimum. The designer must surely have started while singing a drawing office parody, "Ten little chassis tubes," and then got down to the last verse.

Apart from these sporting types there is the ample range of medium and heavy touring sidecars of sound design and a commercial box body, which would be readily interchangeable on certain of the touring chassis.

Roomy comfort rather than super streamlining has been the aim of the Martinsyde sidecar designer

Stand**DIAMOND.**

56. Though a long list of Diamond models will be shown, the frames and specifications are similar, the variations being in the engines and transmission. It is to the frame that special attention should be drawn, for the duplex detachable down tubes and removable tank rail and features peculiar to this make which have well withstood the test of time. Fitted with a 350 c.c. J.A.P. engine and three-speed Sturmey-Archer gear, the super-standard model is very attractive. The chains are entirely enclosed, and the fittings and finish are beautifully carried out. Similar to this, but with no kick-starter, and with carrier replaced by a combined guard stay and toolbag support, is the sports model, while the same engine may be obtained with two-speed gear and chain and belt drive. A 250 c.c. J.A.P.

may be fitted with either two or three-speed Sturmey-Archer gears and a 293 c.c. J.A.P. with Enfield or Sturmey-Archer two-speed gears. In addition, a Villiers two-stroke model will be shown with two-speed gear, and single-gear. The direct action rear brake is well known to our readers, and remains a feature of all models. The tanks are panelled in a pleasing shade of green.

Stand**P. and M.**

57. With one of the oldest names in the motor cycle world, the P. and M. motor cycle is the result of slow but cer-

Simple timing gear of the new P. & M. engine. This picture also shows one of the neat valve and valve-spring covers in position.

tain evolution. Little by little the design has changed from the original model of pioneer days, but at no time have the alterations resulted in a departure from the original layout. This year, however, there are at least very important changes. The engine has been enlarged to 555 c.c., and four speeds are now provided in the place of the two ratios previously used. The two extra speeds are obtained by means of a simple form of gear box working in conjunction with a modified form of the well-known selective clutch two-speed gear.

Forecast and Guide to Olympia.—

In general appearance the P. and M. has been improved also, and an unusual fitment (which should form part of every sidecar machine) is the ratchet brake, by means of which the outfit may be left standing on a hill without the necessity of "scotching."

Stand**MILLFORD SIDECARS.**

58. Last year the old-established Coventry house of Mills-Fulford, Ltd., departed from the beaten track by adopting a design of chassisless, semi-flexible, and completely sprung sidecar which had been evolved on the rough roads of Australia. This design, the Rock, and marketed as the Millford-Rock, will again be exhibited, for its success is assured, especially in the overseas markets, where rough roads prevail.

On more conventional lines a number of medium and luxurious heavyweight sidecars will be staged. These are chiefly mounted on very sturdy chassis of rectangular form, having both axle and longitudinal members duplicated, thus giving a very powerful construction.

Bodywork is the object of special attention on all

spring frame machine, it is reputed to be very fast indeed, which is not surprising considering the long list of Indian racing successes. All the

Increased engine capacity (555 c.c.) and a four-speed gear should more than ever ensure the success of the P. & M. as a go anywhere dual-purpose mount.

the Powerplus spring frame sidecar machine. This year the demand for a rigid frame big twin is met by an enlarged edition of the 4 h.p. to be called the Indian Chief. And what could be more apt than the Princess as a title for the new sidecar? This latter product

models are now fitted with a new and more accessible type of Splitdorf magneto.

Stand**REX-ACME.**

61. An extremely serviceable and solid-looking dual-purpose mount is the chief new model bearing the combined names of Rex and Acme. Engined with

One of the simplest and lightest motor cycles on the market—the single-speed, two-stroke, $1\frac{1}{2}$ h.p. J.E.S.

Saddle suspension on the 8 h.p. Rex Acme.

Millford productions, and the family man should make special note of this stand, for several of the sidecars are provided with a small extra seat in the forepart for the accommodation of an additional small passenger.

Stand**J.E.S.**

59. The J.E.S. motor cycle returns to Olympia with a splendid reputation accruing from several years' service. It is a machine which forms a step between the auxiliary-powered pedal cycle and the motor cycle of conventional type. Several models will be exhibited, including single and two-speed two-stroke machines having a bore and stroke of 60x60 mm. (170 c.c.). The single-speed models are now obtainable with a free engine clutch pulley.

J.E.S. miniature machines will also be exhibited with a new four-stroke engine of 60x60 mm. (170 c.c.), and a lady's model fitted with this engine will be staged.

Stand**INDIAN.**

60. There is no motor cycle manufacturing concern which chooses more appropriate and happy names for its products than the Hendee Mfg. Co. Last year there was the Scout solo mount and

is interesting, having an American body of pleasing if unusual contour on a British-built chassis. The new 7.9 h.p. is fitted with a Daytona engine of 980 c.c., and although this model costs more than the

a new pattern 550 c.c. J.A.P. in a slightly modified form, which drives by chain throughout, via a Sturmey gear box,

An addition to the Hendee range of machines—the 986 c.c. Indian Chief, in reality an enlarged edition of the Scout model.

Forecast and Guide to Olympia.—

this machine is distinguished by its robust and clean framework and good quality detail fittings. Brampton forks and dummy belt rim brakes on both wheels are included in the specification. A roomy sidecar finished in mauve to match the tank may be supplied if desired. The big twin outfit is now offered with a choice of power units—J.A.P. or Blackburne—and of final drives—belt or chain; otherwise it is unaltered. Other Rex-Acme models include a two-stroke in various forms, and J.A.P. and Blackburne-engined machines of 2½ h.p. In the latter case, the drive is by chain, and a lightweight three-speed Sturmey gear box is incorporated.

Stand**HOBART.**

62. Several departures of importance have been made to the Hobart lightweights for 1922.

An addition to the Rex Acme range—a 2½ h.p. two-stroke with Sturmey-Archer gear.

These innovations, however, do not affect the well-known spring frame design, although rigid frame models of all the types are now obtainable. Fuller particulars of the new models, which include Morris, J.A.P., and Blackburne-engined machines, will be found on another page of this issue.

Stand**MORGAN.**

63. Observant motor cyclists have noticed that, during many trials this year, Mr. H. F. S. Morgan has used what has been described as a special short wheel-base model. The Morgan Motor Co. has now decided to market this type, which, fitted with an air-cooled 8 h.p. J.A.P. engine, of the latest type, will be sold at the low figure of £150. Its weight is

The Ivy sports model two-stroke. The large flywheel contributes to the smooth running of the engine.

An addition to the Morgan range of three-wheelers—a sporting model with a slightly shorter wheelbase than the standard machines.

only 4¾ cwt., but comfort has not been sacrificed in order to attain this, as a comfortable body is fitted, having a side door and an adjustable screen. Hood, horn, acetylene lamps, two mats, licence holder, tools, and oilcan form part of its equipment.

Stand**IVY.**

64. Having distinguished itself before the public by feats of endurance, power, and speed, the Ivy two-stroke will surely attract a number of interested spectators. This make has done much towards popularising the lightweight sidecar movement by its consistently good performances with a roomy but light passenger attachment. Visitors should take note of a new cylinder casting, which is a fine piece of construction. The aim of the company has been to produce a steady

Sporting Matchless outfit with spring frame and spare wheel.

pulling light sidecar outfit capable of taking a passenger wherever road grip can be attained, and for this reason it must not be confused with certain ultra-light runabout outfits. The solo and sporting interests have not been forgotten, and specimens of these will, of course, be exhibited.

Stand**MATCHLESS.**

65. Two distinct types of Matchless machines will be staged, each with 8 h.p. engines, the difference being in the frame construction. The now well-known Model H, with spring frame, is retained, and may be obtained (1) with ordinary touring sidecar body, which now has a hinged dash; (2) with a two-seated family

Forecast and Guide to Olympia.—

sidecar of a new type—the door to which swings from either jamb; and (3) a sporting sidecar. In the last-mentioned, an engine specially tuned for speed is fitted.

The second type has a rigid frame, and is intended as a big twin dual-purpose mount.

Several minor improvements have been embodied in the construction of the Model H, one of them being alterations which permit the sidecar seat to be lowered.

Stand

HAZLEWOOD.

66. Though not newcomers to the lightweight market, the Hazlewood factory has not produced this type for some years. Consequently it is of special interest to note a neat J.A.P.-engined machine appearing under the Big H. mark. Alternative specifications are offered as far as transmission is concerned, and a sporting model is manufactured. An unusual system of rear braking is employed on this machine, the shoe, heel pedal, and connections being mounted on a common lug, the whole unit being quickly detachable should need arise to remove the rear

One of the Hazlewood range, fitted with 2½ h.p. J.A.P. engine and two-speed Sturmey gear box.

Wheel. Well-known Hazlewood models that are retained include an 8 h.p. and 6 h.p. twin; a new 4 h.p. single will also be shown, all having J.A.P. engines.

Stand

LEVIS.

67. Apart from the fact that two sizes of Levis engine (211 c.c. and 247 c.c.) are made, the chief difference in the various models of this pioneer two-stroke lightweight lies in the presence or absence of a gear box and kick-starter. A new design of frame, however, has made a wonderful improvement in the appearance of the larger 2½ h.p. model. The straight top tube slopes to the rear, and the tank is carried on platforms brazed to the detachable lower rails. 1½ gallons of petrol and half-a-gallon of oil may be carried, which should suffice for more than two hundred miles without refilling.

Stand

DUNHILL SIDECARS.

68. Dunhill sidecars are famous for their chassis construction, and several examples will be seen on this stand. These chassis are noted for their rigidity and are triangular in form, giving great strength. Other features are straight-through axles and the attachment of the mudguard to the chassis at three points, so that there is no possibility of trouble through the mudguard stays breaking.

A well-trying two-stroke—the 2½ h.p. two-speed Levis.

The wheel hub is of heavy construction and dust and waterproof, while 26in. wheels are fitted. The firm make a speciality of a sidecar luggage carrier which weighs but 5 lb., and is constructed of ½in. diameter steel tube. It can be

well made, strongly and carefully constructed, and light in weight.

Stand

NEW IMPERIAL.

69. Undoubtedly in the smaller class of four-stroke lightweights, the most consistently successful machine in competitions during 1921 has been the New Imperial. Not only did this little machine win *The Motor Cycle Cup* in the Junior T.T., but it has been equally successful in reliability trials and speed events. The New Imperial lightweight range for 1922 will include three distinct types, with 250 c.c., 293 c.c., and 350 c.c. engines respectively. The first-named will be staged in two types: an entirely new model known as the Baby New Imperial, with 24in. wheels, three-speed gear, all-chain drive, and a sports model with special three-speed gear without kick-starter. The improved frame construction, allowing unit assembly of engine and gears, is a feature to be looked for.

The next model will approximate to the present New Imperial Light Tourist, but will have a three-speed gear box, with or without clutch and kick-starter, and chain-cum-belt or all-chain transmission. The third type has an engine of 350 c.c., and is a sports model on similar lines to the 250 c.c. sports model.

In addition to the solo machines, two 8 h.p. sidecar outfits will be exhibited, one of which, being a new type of 8 h.p. machine, will be staged as a sports model, which indicates that this firm, like several others, is making a bid for the demand for a really fast big twin.

Compact appearance on the 2½ h.p. New Imperial is gained by housing both gear box and engine as a unit assembly within the loop frame.

Forecast and Guide to Olympia.—

Stand

RALEIGH.

71. Distinguished alike for its fine finish and its comfort, the 5-6 h.p. spring frame Raleigh will no doubt remain the centre of attraction on this stand. At the same time the new lightweight single should run it a close second in popularity, particularly by reason of the moderate price and the name behind it. With a 3 h.p. (400 c.c.) engine and three-speed gear, this model is marketed as a sidecar outfit. At a slight extra cost the 348 c.c. lightweight may also be supplied with a three-speed box, but in its normal form only two ratios are obtainable. With T.T. bars and footrests instead of boards, the 2 1/2 h.p. single makes an attractive sports model. All the lightweights are under the 200 lb. taxation limit. Little change will be noticeable in the big flat twin, but since the last Show very considerable improvements have been made to the sidecar and its chassis.

Stand

SUN.

72. Besides the standard Sun two-stroke, which will, of course, be staged with single or two-speed gear, there will be several examples of the rotary valve engine. Interest on this stand is bound to centre on this novel engine, which, it will be remembered, made its *début* to the public in the Isle of Man.

The main feature is a rotary disc valve driven from the crank web. A port

in this rotating disc uncovers a corresponding port in the crank case, to which the carburetter is attached; thus the induction stroke is timed as far as mixture is concerned. There is, however, an air port in the cylinder, controlled by the piston in the normal manner, through which air only may be induced. It has been found that a considerable improve-

This all-chain drive model should multiply the admirers of the Zenith-Bradshaw.

ment in power and flexibility has been obtained by this arrangement.

Visitors will be enabled to study the action of the valves on a sectioned engine driven at low speed from an electric motor. A two-speed Sturmey-Archer is the standard gear, but a three-speed Moss with all chain drive will be fitted for use with a light sidecar. A new model, fitted with the 293 c.c. J.A.P. engine and

two-speed Sturmey-Archer gear, with clutch and kick-starter, will also be shown.

Stand

REYNOLDS.

73. In addition to the standard type of Reynolds runabout, which is now fitted with chain drive throughout, 24x24 in. tyres, Maplestone forks, and a 2 1/2 h.p. Liberty engine, an entirely new tandem-seated vehicle will be staged. Buckle seats, deeply upholstered and supported on coil springs, are provided for both driver and passenger, and ample legshields, rubber-covered floor, and running boards, and wide mudguards give all the protection which is possible on a two-wheeler. A duplex frame, strengthened by auxiliary tubes wherever necessary, carries a 350 c.c. J.A.P. engine and three-speed gear, with clutch and kick-starter bolted together as a unit. All chain drive, internal expanding brakes fore and aft, 26x2 1/2 in. tyres, and Maplestone forks are fitted. Engine and transmission are almost completely out of sight, and interest is bound to be attracted by this very unusual type of two-wheeled machine.

Stand

ZENITH.

74. The chief item of interest on the Zenith stand will be the chain-driven Bradshaw-engined model, which is a dis-

Particularly suitable for ladies' use—the two-stroke Sun Vitesse.

ting departure from the procedure followed by this firm since its inception, being the first all-chain drive type introduced. A detailed description of this machine appears elsewhere in this issue. Four examples of this new model will be shown, and four Bradshaw-engined Zeniths, which will be belt-driven and with the Grauda gear. These exhibits will demonstrate the cleanness of design of the Bradshaw oil-cooled engine, a road test of which was described in *The Motor Cycle* of November 10th. There will also be a 5 h.p. J.A.P.-engined sports model, a 5 h.p. J.A.P.-engined machine with clutch, and an 8 h.p. sidecar outfit with counter-shaft drive and clutch. The requirements of all classes of riders have been studied, and the machines range from the fastest and most powerful twin-cylinder to the mediumweight sports models, while the family man's requirements have not been overlooked, the sidecar outfit being a thoroughly well-designed and practical mount.

Stand

ARGSON.

76. Necessarily in a class by itself the Argson invalid tricycle resembles anything else at the Show only in its power.

Forecast and Guide to Olympia.

unit—a two-stroke flywheel magneto engine. It is simply and solely a self-propelled invalid chair, and comfort and convenience have naturally been considered, to the exclusion of super-hill-climbing and speed capabilities. Unfortunately, this type of vehicle will interest many, and it fully deserves its place at Olympia.

Stand**YOUNG.**

77. The popular Young motor attachment which can be fitted to pedal cycles, or preferably sold complete by its makers, has not undergone any startling alterations. A simplified form of spring fork attachment has been made which should greatly add to the rider's comfort. In the case of the little $1\frac{1}{2}$ h.p. (54×57 mm.) two-stroke engine, one important innovation is the fitting of an aluminium cylinder with cast iron lining; the short exhaust pipe from the cylinder forms part of the cylinder casting, and is heavily ribbed to aid cooling.

Suitable for fitting to any existing pedal cycle—the Young motor attachment. The capacity is 130 c.c.

in sporting or full touring models, is superlative in finish, and even the former type is roomy—more so than many of its fellows.

Also to be shown on the Whitley stand is the Girdex sidecar, an unusual construction embodying a chassis of two intersecting pressed steel girders. Great

A new Enfield sidecar, designed to accommodate two passengers in comfort. When the door is closed the external appearance is quite pleasing.

The exhibit will consist of special bicycles fitted up with the Young attachment, both for ladies and gentlemen, and a tandem bicycle. What is known as the *de-luxe* model will also be shown, to be sold complete with acetylene lamp, tools and spares, and the new forks in which the spindle floats between two enclosed springs, and is adaptable to any pedal cycle.

Stand**WHITLEY SIDECARS.**

84. Comparatively new as a firm, the Whitley Manufacturing Co., of Charterhouse Mills, Coventry, has, in its controlling force, a tradition for superfine finish, choice materials, and honest workmanship. It follows, therefore, that the Whitley productions should be distinguished by the above-mentioned qualities, some of which are observable, while all are there.

Startling originality is not sought in the range of attachments which will be shown, yet there is more than ordinary merit in the couplings used to link up the sidecar with its propelling machine; a great point also is in the machining of all connecting lugs, either from the solid or from steel forgings. Bodywork, both

strength with light weight are its special features.

Stand**NEW SCALE.**

85. Three models only of the New Scale will be shown, as it has been decided to abandon the two-stroke and con-

A popular Royal Enfield model is the $2\frac{1}{4}$ h.p. two-stroke, with kick-starter.

centrate on solo and sidecar four-stroke singles. Two dual-purpose machines are fitted with the 4 h.p. and $2\frac{3}{4}$ h.p. Blackburne engines respectively, three-speed Burman gear boxes, and all-chain drive. A similar specification holds for the exclusively solo model, which embodies the o.h.v. $2\frac{3}{4}$ h.p. Blackburne engine and a Burman gear without kick-starter. All three are finished in red, and are not lacking in appearance.

Stand**ROYAL ENFIELD.**

86. Royal Enfield owners will find but few alterations to existing models in the 1922 range. The $2\frac{1}{4}$ h.p. two-stroke has practically the same specification, with the exception that the saddle is anchored to the top tube of the frame and to the carrier, thereby saving weight.

The 8 h.p. type, which is engaged by a power unit built for the Enfield Co. by Vickers, Ltd., remains unaltered except for equipment. In this respect it is interesting that the Terry patent spring saddle will be fitted as standard, while the wheels are shod with Dunlop 700×80 tyres.

Entirely new types of sidecar bodies have been adopted, attention being paid particularly to the provision of ample accommodation for luggage by means of a large locker at the rear, to the lid of which is affixed a rubber platform and fittings to allow further luggage to be carried.

Instead of the green upholstery previously used, the body will be upholstered in black rubber cloth. A new design of two-seated body, with most distinctive outlines, will also be a feature—this has a folding front seat.

Stand**BEARDMORE-PRECISION.**

87. Developments of interest to both soloist and sidecarist have been made to the Beardmore-Precision range for next year. Chief is the new big single four-stroke of nominally $4\frac{1}{4}$ h.p., which is assembled in a "semi-unit" construction with the gear box. Before the war, a Precision of this type made a wonderful name for itself, and the modern version should attract considerable attention in consequence. The 3 h.p. two-stroke re-

Forecast and Guide to Olympia.—

An effectively sprung single-cylinder machine—the new 4½ h.p. Beardmore-Precision. The engine and gear box are combined in one unit.

tains its advanced features of design, i.e., pressed steel tank forming a frame member, "chain elevator" lubrication system, and efficient spring frame. In conclusion, one of the lighter sports models will be fitted with the 350 c.c. Barr and Stroud sleeve valve engine.

Stand

BRADBURY.

88. With the introduction of a 996 c.c. Bradbury twin, the 1922 range bearing this old-established name is very complete. Engines and gear boxes (when fitted) are all of Bradbury manufacture. Chain drive via a three-speed box is now incorporated in all the larger models, i.e., the 554 c.c. single and the 750 c.c. and 996 c.c. twins, which make sturdy sidecar machines of good performance. The 2½ h.p. solo or light sidecar

Well-balanced lines lend the 6 h.p. Bradbury an imposing appearance.

Elimination of the non-essentials is the motif of the sports Ariel.

machine may be obtained either single-gear or with a two-speed box with or without clutch and kick-starter. Final drive in this case is by belt. An M-L Maglita to the single, or a Lucas Magdyno to the twin, may be fitted optionally.

Stand

ARIEL.

89. The 3½ h.p. Ariel was noteworthy during 1921 as a three-speed countershaft gear machine selling at £100. For next year a re-designed sports model of this type will be priced at £87 10s., which is nearing pre-war value in this class of machine. No kick-starter is fitted, and other unessential details, such as the Ariel spring seat-pillar, have been eliminated. Nevertheless, it promises to be a most attractive solo mount. The corresponding touring model and the 4½ h.p.

A model free from embellishment yet quite a practical light touring mount—the 2½ h.p. single geared two-stroke Calthorpe.

sidecar single have not been altered in specification; but the 6.7 h.p. twin is now offered with a final belt drive only; and an 8 h.p. M.A.G.-engined machine has been produced as the all-chain twin. This is a fully-equipped model with large sidecar and 28×3in. wheels.

Stand

CALTHORPE.

90. Having pleasant recollections of a neat little 4 h.p. twin-cylinder outfit which the Calthorpe Co. made before the war, we are glad to announce that the chief item of interest on this stand will be a similar machine on up-to-date lines. The engine fitted is a 4 h.p. J.A.P., and the specification includes Sturmey-Archer three-speed gear.

In addition, there will be the company's usual range of lightweights augmented by a single gear model, having

a two-stroke engine of 247 c.c. capacity which will be offered at a moderate price.

Stand

O.K.

91. Few, if any, makers of light weight sidecar machines have a competition record with this type equal to the manufacturers of the O.K. The O.K. sidecar outfit staged here will, therefore, most assuredly attract attention from those seeking a means of transport for two at a moderate price. An O.K. engine and a Moss gear box are fitted to this model. An all-chain solo machine, also, only supplied with the O.K. power unit may be obtained either with a touring or sports specification; the latter at a slightly lower cost. A choice of Villiers or O.K. engines is offered in the popular single

Forecast and Guide to Olympia.—

gear model, and the same option holds good on the plain two-speed, two-speed with clutch and kick-starter, and three-speed (Albion) models. Several detail refinements have been introduced throughout the O.K. range.

Stand**DAYTON.**

92. For the first time since the war the Chas. Day Mfg. Co., Ltd., will be showing a motor bicycle. The new Dayton is a lightweight driven by the $2\frac{1}{2}$ h.p. Villiers engine with magneto flywheel, mounted in a frame of all steel construction, in which is incorporated a substantially webbed head lug and a further webbed lug on the saddle tube, to which is bolted the pressed steel tank. Lubrication is effected by air pressure through a drip feed. Both brakes controlled by heel-operated pedals mounted one on each footrest are applied to the outer side of the belt rim. The Dayton motor bicycle will be shown in three types—single geared, with clutch, and with Sturmey-Archer, two-speed gear and kick-starter. Another interesting feature of the exhibit will be a three-wheeled single-seater driven by a 4 h.p.

Few lightweights enjoyed the popularity of the O.K. this year. Above is the three-speed model for 1922.

resemblance to the touring machine, but is equipped with the usual T.T. paraphernalia, and has no kick-starter. A decidedly attractive little sidecar has been designed for this model, and the roomy

reputation for good bodywork, however, for a considerable time. Many well-known sidecar outfits are mounted with bodies of Willowbrook manufacture.

For 1922 a couple of lightweight models are included in the range, both being mounted on a triangulated chassis and differing in bodywork, one being in polished aluminium with a hammock seat, the other being on more conventional lines. In addition, standard touring models and a taxi-sidecar will be exhibited, attached to an all-chain-driven 8 h.p. Rex-Acme.

Stand**CONNAUGHT.**

98. Two-stroke lightweights only have borne the name of Connaught in the past, and consequently efficient design may be expected as the result of this specialisation. The $2\frac{1}{2}$ h.p. Connaught has had a most creditable competition record this year, and has proved itself as a capable little solo machine. A new model for sidecar work will be exhibited, which has a two-stroke engine of 370 c.c.—an unusual size. The sidecar body will be quickly detachable for substitution of a tradesman's carrier.

Stand**NORTON.**

99. There is little need to describe either the $3\frac{1}{2}$ h.p. or the "Big Four" Norton. Suffice it to say that no modifications of any importance have been found necessary. Capped or "acorn" nuts are fitted where possible, a

A genuine attempt at simplicity with a capital "S" has been made in designing every part of the $2\frac{1}{2}$ h.p. Spark.

Blackburne engine with three-speed gear box, chain-cum-belt drive, and wheel steering. The engine will be situated in front, and every wheel is sprung, as is also the coachbuilt body.

Stand**SPARKBROOK.**

93. Perhaps the most interesting machine in the Sparkbrook display will be the new Villiers-engined Spark. Having a frame in which no castings are employed, and a steel tank incorporating an air-pressure lubrication system, the little machine bristles with novelties, and is well worth a close study. The Spark will be sold as a single-geared or clutch model, but the standard Villiers-engined Sparkbrook models are retained, and may be fitted with the Sparkbrook two-speed gear and clutch. Another new model, having a 350 c.c. J.A.P. engine and three-speed Sturmey-Archer gear, will also be shown.

Stand**ROVER.**

96. All the Rover models for 1922 will be frankly dual-purpose machines, and as such will be shown. There are three: the 5-6 h.p. J.A.P.-engined twin, the $3\frac{1}{2}$ h.p. touring single, and the $3\frac{1}{2}$ h.p. sports single. The latter bears a strong

standard attachment will be retained for the touring single and twin. Belt drive has been abandoned entirely.

Stand WILLOWBROOK SIDECARS.

97. The sidecars produced by the Willowbrook Motor Co., of Belgrave Gate, Leicester, are on straightforward lines. The concern has held its excellent

A mediumweight twin popular for solo as well as sidecar work—the 5-6 h.p. Rover.

ROYAL RUBY.

101. Two distinct types of motor cyclists now have an interest in the Royal Ruby range, which embraces 8 h.p.

the new tandem sidecar, seating two adults, on the 8 h.p. model should be of special interest.

Stand

ALLON.

102. Interesting features which should not be missed on the Allon exhibit are the horizontally split crank case and the method of casting in the oil leads. Cylinder and top half of crank case are cast together, and the engine unit is held in, the frame by lugs placed above the crankshaft centre, so that it is only necessary to detach the lower half of the crank case in order to remove the crankshaft, connecting rod, and piston.

A large bore steel oil pipe leading to each crankshaft bearing is cast into the crank case so that only one oil-union is necessary and a multiplicity of bent tubes is avoided. Larger bearings have been fitted, and the piston has been modified to obtain lighter weight and better gas flow.

Several detail modifications are incorporated, including wider mudguards and longer wheelbase.

A Villiers flywheel magneto is now fitted, thus avoiding an auxiliary chain drive which might cause

One of the fastest sidecar machines on the road, the "Big 4" three-speed Norton.

slightly different tank finish has been standardised, and the detail work has been cleaned up to some degree. The success of the Norton during the past twelve months has even exceeded its previous record, and the standard models are well-known throughout the length and breadth of the country.

Stand

EXCELSIOR.

100. Excelsiors, particularly the sidecar models, possess an exceptionally good record of competition successes. These machines especially distinguish themselves in climbing difficult hills; and, although admittedly their drivers are experts, only a very sound machine gains premier awards in the hotly contested reliability trials of to-day. For next year the same three models—the 4½ h.p. "big single," the 6 h.p. J.A.P., and the 8 h.p. J.A.P.—will be continued. The single is a strongly built heavy service machine, and although rated at 4½ h.p., the engine capacity is 650 c.c. 28×3in. tyres and a large tank are useful points. The "six" is down as a "popular" model, and as the price is extremely moderate it should continue to live up to its name. Fitted with the new J.A.P. twin, the 8 h.p. outfit aims at a "luxury" specification, but a reasonable selling price. Villiers and Blackburne-engined lightweights are also manufactured.

luxurious spring frame sidecar outfits, and 2½ h.p. to 3 h.p. lightweights with and without sidecars. When a spring frame is embodied in the 3 h.p. (375 c.c.) model, it is offered as a solo mount only. Three-speed gear boxes of Royal Ruby manufacture are standard on both of the lightweight models, and in each

The popular Allon two-stroke has now a flywheel magneto.

case final belt drive is fitted; the engines are also the factory's own product. The 2½ h.p. (349 c.c.) model is classified as a sports type, and when a sidecar is attached it is of the (doorless) Canoelet make. To the larger lightweight is fitted a more elaborate sidecar complete with a door.

For those who habitually carry more than one passenger

noise. This ignition set may be converted to provide current for lighting at a very moderate cost. Sensible legshields are included in the specification, and an unusual feature is the fitting of the Allon special band brakes to both front and rear wheels.

Stand

CHATER-LEA.

103. For 1922 Chater-Lea, Ltd., will specialise in two patterns of lightweights—a *de luxe* and a Popular model. Of these, the latter is fitted with a 2½ h.p. Villiers engine, with separate magneto.

The *de luxe* model also has a 2½ h.p. two-stroke engine, which is fitted with extra long gas-tight bronze bearings and an efficient silencer and extension pipe, while the compression release is carried into the exhaust. The machine can be fitted either with clutch and kick-starter or with clutch only, while the gear is changed by means of the Chater-Lea delay-action gear control. Roller and ball bearings are embodied in the gear box, and the ratios are 6 and 10½ to 1. The kick-starter has its mechanism entirely enclosed. An improved type of spring fork with substantial link plates and hardened bolts has been evolved.

Features of both this and the popular models are the Chater-Lea wheel hubs with

A comfortable, fast, and powerful sidecar outfit; the electrically equipped 8 h.p. Royal Ruby. sprung fore and aft, and fitted with leg guards and undershield.

Forecast and Guide to Olympia.

disc-adjusting bearing, which allow the wheels to be removed without interfering with the adjustment. The rear wheel is provided with a knock-out spindle, and, by the use of hinged distance pieces, the inner tube can be changed without removing the wheel from the frame.

A modified 8 h.p. sidecar model will also be shown with three-speed gear and plate clutch on the engine-shaft; a clutch stop is added to the latter.

Stand

JAMES.

104. There are four widely differing James models for 1922, but each is a very creditable example of its type. For the sporting soloist the re-designed $3\frac{1}{2}$ h.p. twin, which now closely resembles the actual I.O.M. and Grand Prix machines, will inevitably appeal. It is as attractive in appearance as it

Fitted with a $3\frac{1}{2}$ h.p. Abingdon King Dick engine and Sturmey-Archer three speed gear, this Mohawk model forms a useful double-purpose mount.

Stand

MOHAWK.

105. The Mohawk Cycle Co. has probably been better known in the past by its pedal cycles than its self-propelled two-wheelers; but for 1922 a complete range of motor cycles will be made. A Villiers-engined two-stroke will be supplied alternatively as a single-gear (direct belt drive) model, or fitted with a two-speed gear box with clutch and kick-starter. Next there is a very similar machine, but fitted with a 293 c.c. J.A.P. A 350 c.c. engine of the same name has served as the basis of a neat sporting solo mount; and in the passenger class there is a single and a mediumweight twin—the former a $3\frac{1}{2}$ h.p. Abingdon, and the latter a 5-6 h.p. J.A.P.

Fine finish characterises the roomy James sidecar, which is fitted with a locker cover that may be dropped to form a dickey seat.

is comfortable to ride, and it will be delivered with a guaranteed speed of 60 m.p.h. Aluminium chain cases and completely interchangeable wheels are the only points upon which it was found necessary to improve the 7 h.p. sidecar outfit; nor has the simpler " $4\frac{1}{2}$ " been basically altered. Both the sidecars, however, have undergone detail changes, making for great comfort and convenience. The light-weight two-stroke in its standard form is unaltered, but a variation is offered with a conventional two-speed gear box and clutch, instead of the twin chain and dog clutch gear arrangement.

An attractive sports lightweight with an o.h.v. engine—the $2\frac{1}{2}$ h.p. Coventry Eagle.

Stand.

COVENTRY EAGLE.

106. The sporting Coventry Eagle has the honour of being one of the earliest lightweights to be turned out as a luxury mount pure and simple. It will be remembered that this model is fitted with a $2\frac{1}{2}$ h.p. o.h.v. J.A.P. engine with several detail refinements and a distinctive design of ribbed exhaust manifold. A handsome saddle tank and clean frame and mudguard lines add to the uncommonly pleasing general appearance of the machine, which, incidentally, is supplied fully equipped down to aluminium number plates. For next year the saddle tank, which made its first appearance on the lightweight, will be fitted to all the Coventry Eagle models. The others are: A $2\frac{1}{2}$ h.p. two-stroke, a 293 c.c. J.A.P.,

Exceptionally deeply valanced mudguards are good features of the $2\frac{1}{2}$ h.p. Chater-Lea two-stroke.

Forecast and Guide to Olympia.—

A miniature machine on light and simple lines—marketed by the Hack Engineering Co.

a 350 c.c. J.A.P. (also offered as a light-weight sidecar outfit), a 3½ h.p. J.A.P. (which may be obtained in a "sports" guise), a 4 h.p. (550 c.c.) J.A.P., and a 5-6 h.p. twin J.A.P. sidecar outfit.

Stand

BLACKBURNE.

108. Two models only of the Blackburne will be shown, both as sidecar machines. The engine of that name will naturally form the power unit for both types—one the 4 h.p. single, and the

A speedy flat twin, the o.h.v. 3½ h.p. Sports Douglas.

other the 8 h.p. twin. Four complete outfits comprise the actual exhibit as follows: An 8 h.p. twin with O.E.C. sidecar, an 8 h.p. three-seated taxi outfit, an 8 h.p. tandem-seated outfit, and a 4 h.p. single with a semi-sports sidecar.

Stand

HUGHES SIDECARS.

116. Newcomers to the proprietary sidecar market, although having much experience of manufacturing for other concerns, Thos. Hughes and Son, of Baker Street, Sparkhill, Birmingham, will show a big range of models. Almost every type of demand is catered for, with (in certain cases) alternatives for similar classes of work or to suit machines of the same power.

A well-upholstered sporting sidecar, of racy shape, with pointed tail, is specially worthy of notice; and another and heavier model, the *Cruiser de Luxe*, follows the same general lines, but is mounted on a duplex chassis, so as to be suitable for use with the biggest and most powerful machines. A feature of the Hughes range is the fitting of scuttle type hinged dashes, carrying windcreens, and aluminium steps mounted on the chassis.

C10

Stand **HACK.**

117. A little machine, mainly intended for runabout purposes, the Hack miniature should prove of value to nurses and others to whom ordinary cycling has been found fatiguing. Its weight is 75 lb. It is fitted with aluminium footboards, down the centre of which runs a groove carrying the control wires to the unit. The engine is the Simplex two-stroke slightly modified and adapted to the

Cylinder head of the 3½ h.p. sports model Douglas.

Hack. Several improvements have been carried out, among which the magneto gear wheels are now enclosed, and the drive is by single chain to the rear wheel, the gear ratio being 10 to 1. A clutch fitted is used solely to disconnect the engine from the road wheels if it is found necessary to wheel the machine,

Stand

DOUGLAS.

119. Douglas machines have good reputations in two distinct quarters. Even the casual dabbler in motoring matters knows and respects the 2½ h.p. model as a general utility machine, while the speed enthusiast is beginning to realise the wonderful capabilities of the three o.h.v. models, which have innumerable Brooklands and hill-climb successes to their name this year. The 2½ h.p. model may be obtained in a variety of forms, but is probably most popular when fitted with a plain clutchless two-speed gear. As a general utility sidecar machine the 4 h.p. type is almost as familiar on our roads to-day, but for high speed sidecarrying the new o.h.v. 6 h.p. model is the more suitable. For fast solo mount, the 2½ h.p. and 3½ h.p. o.h.v. models are, of course, retained. All the Douglas machines are sold complete with lamps, horn, etc.

Stand

RUDGE.

and this is controlled by a lever on the handle-bars, the first operation of which releases the compression, while the second disengages the clutch. The clutch, therefore, cannot be used for starting purposes, but this is not an extremely difficult operation.

There is an impressive air of solidity and power about the three-speed 7.9 h.p. Rudge.

120. After just one year's existence on the market it has not been found advisable to alter greatly the counter-shaft three-speed all-chain drive Rudge singles and twins. Since last Show, however, a much less cumbersome form of clutch has been evolved, but this innovation is not new to the public, for it has been fitted to the production machines for some time now. It is of the usual Ferodo insert type, but is carried on the engine-shaft instead of on the gear box; it embodies an efficient transmission shock absorber. A black enamelled aluminium chain case and guard now protect the primary and rear chains respectively, and the footboards are also of the same metal but in its natural finish. Large capacity tanks,

Forecast and Guide to Olympia.—

very strong wheels, and a most efficient front fork are features that have long been common Rudge practice. The two multi gear (belt drive with expanding and contracting pulleys) models remain in the form which enjoyed so much popularity in the past.

Stand**SUNBEAM.**

121. One would not be far wrong in crediting the Sunbeam designers with having set the fashion in the "sports model," when, last year, they introduced a light semi-T.T. machine, less kick-starter, exclusively for solo use. It was almost alone then, but this year it is extremely difficult to find a firm that is not listing a "sports model." The enthusiastic solo rider has already much for which to thank the Sunbeam makers, but for 1922 he has even more reason to be pleased. A new long-stroke T.T. model has been introduced, which really does follow the lines of the I.O.M. machines, being a "clubman's 'bus" pure and simple. The sporting model of 1921 is retained, with the addition of a kick-starter, as a fast touring solo machine; and the $3\frac{1}{2}$ h.p. standard has been modified for dual-purpose use. Another new long-stroke single of $4\frac{1}{4}$ h.p. has been evolved for purely sidecar work; while, of course, the popular big twin is retained. Excepting the T.T. machine, all have the Sunbeam oil-bath chain cases front and rear.

Stand**MONOPOLE.**

122. Improvements in the Monopole range are chiefly limited to the detail alterations to their components already described in several recent issues of *The Motor Cycle*. From this it may be inferred that the machines bearing this transfer embody familiar gear and engine units. Nevertheless, they are all serviceable and roadworthy productions. The chief types are: Villiers 293 c.c. and 350 c.c. J.A.P.-engined lightweights (the latter as a sports model), and 499 c.c. Abingdon and 654 c.c. J.A.P. dual purpose models.

Stand**VICTORIA.**

123. As last year, competitive prices will be a strong feature of the Victoria exhibit, which is, incidentally, one of the few representatives from beyond the Tweed. Lightweights, mediumweight singles, and a Coventry Victor-engined flat twin are the chief models. Well-known components are embodied, Villiers, Blackburne, and J.A.P. engines being fitted to the singles. Sturmer-Archer three-speed gear boxes are used on the heavier sidecar machines, and it is worthy of note that a single-gear direct belt drive model, with a 4 h.p. J.A.P. engine, is listed.

Stand**HUMBER.**

124. The $4\frac{1}{2}$ h.p. flat twin engine of the Humber is a most adaptable power unit. Not only is it fitted to a smooth running sidecar outfit of proved capabilities and noiseless action; with detail modifications it now provides the power for a 70 m.p.h. solo machine selling at a most moderate price. The modifications in question consist mainly of lighter reciprocating parts, aluminium pistons, providing a higher compression, and

All the essentials of a practical touring solo machine are embodied in the lightweight Monopole.

One of the few representatives of Scotland—the $2\frac{1}{2}$ h.p. two-stroke Victoria.

The new long-stroke T.T. Sunbeam.

The standard Sunbeam " $3\frac{1}{2}$ " is now a dual purpose machine, a step between the Sports and the $4\frac{1}{4}$ h.p. sidecar models.

Forecast and Guide to Olympia.—

For those who favour the flat twin the smooth running $4\frac{1}{2}$ h.p. Humber is attractive. The illustration depicts the sports model.

A Wolf single geared model two-stroke fitted with flywheel magneto.

redesigned exhaust pockets to allow a free sweep to the exhaust gases through two unrestricted pipes. Detachable valve pockets, one of the Humber's special features, are retained on both the touring and the sports models. A Grindlay sidecar of pleasing and dignified appearance converts the touring machine into a capable passenger outfit.

Stand

WOLF.

125. A special feature of the Wolf exhibit will be a miniature lightweight embodying the Villiers engine. It will be staged at a very competitive figure, and offered with various alternatives, such as Sturmey or Burman two-speed gear with clutch or kick-starter, or with single gear and Villiers engine-shaft clutch. Lighting sets operated from the flywheel magneto may be added. The usual range of Wolf models will also be shown.

Stand

BOWN.

126. Among the lesser known, but none the less efficient lightweights of Birmingham manufacture, the Bown is the product of an extensive and well-equipped factory. Two models are specialised upon—a $2\frac{3}{4}$ h.p. Blackburne mount with a two-speed gear and final belt drive, and a very similar machine with a Villiers two-stroke engine. These are both intended for solo work, for so far the makers have not recommended their bigger machine for light sidecar service.

Stand

A.J.S.

127. It is difficult to decide whether the greater public interest will lie in the popular 7 h.p. A.J.S. sidecar outfit or the

new $2\frac{3}{4}$ h.p. models. The former has been modified only in minor respects. A new front mudguard gives a neater aspect, and permits a better flow of air to the engine. Larger exhaust pipes are fitted, and the rake of the sidecar seat has been altered to provide greater comfort. Three types of the $2\frac{3}{4}$ h.p. model will be shown—

Lubrication system of the $4\frac{1}{2}$ h.p. flat twin Humber.

touring, standard sports, and stripped sports—and, in addition, the touring model will be shown with a light sidecar. Side-by-side valves, three-speed gear with clutch and kick-starter, excellent guarding, a new type of Druid fork, and all-chain drive, are features of this neat

A mediumweight four-stroke—the $2\frac{3}{4}$ h.p. Bown, fitted with Blackburne engine and Sturmey-Archer gear.

The speedman's mount, a stripped sports $2\frac{1}{2}$ h.p. A.J.S., with no kick-starter, light chain guards, and racing mudguards. The carrier is easily detachable and leaves the rear guard well supported.

Forecast and Guide to Olympia.—

little machine. The standard sports differs in that footrests are fitted in place of aluminium and rubber boards, while the engine has higher compression and higher valve lift. As its name implies, the "stripped sports" is minus all unnecessary fittings, such as kick-starter, etc., while narrower front mudguards and lighter chain guards are fitted. The new frame fitted to all three light machines is particularly attractive.

Stand**SCOTT.**

128. There will be few alterations to the Scott models for 1922; but these machines remain in many respects unique. The sports or Squirrel model, exhibited for the first time last year, will again be on view after a successful year in the hands of the public. Minimum speed and consumption for this type are guaranteed as 60 m.p.h. and 75 m.p.g. respectively. There will also be a Colonial model Scott, with 8in. ground clearance and 28x3in. wheels, while another innovation is the Squirrel outfit with special light sidecar.

Stand**SANDUM SIDECARS.**

129. Sidecar enthusiasts will find the Sandum exhibit of particular interest. The chief feature will be a double-seated sidecar carrying two passengers side by

Although a trifle unconventional in appearance, this model of the 2½ h.p. o.h.v. Sheffield-Henderson-Blackburne has already won its spurs in the big speed trials.

side fitted on a standard chassis, this being effected by sinking the foot well inside the chassis longitudinal members, and allowing a slight overhang. On all the heavier Sandum sidecars the wheel spindle is supported at its outer end. Another interesting portion of the exhibit will be the Sandum-Easting wind-screen, which can be adjusted to any angle, and made to protect the passenger entirely. Sandum bodies are covered in special material, which is afterwards painted and varnished, and is weather and sun-resisting. A speciality is also made of lightweight bodies, several examples of which will be shown. One of these, of streamline form, will weigh but 24 lb. Another feature of the exhibit will be a teuring body with a rubber-covered lid to the locker at the back.

Stand . SHEFFIELD-HENDERSON.

139. In addition to a range of Henderson sidecars for which this Sheffield firm is now well known, two new models of the Sheffield-Henderson motor cycle will be exhibited; one of these will be engined with the 2½ h.p. o.h.v. Blackburne engine, and having a frame of rather unique design, which gives an exceptionally low riding position.

A model which will always have a following on account of its many distinctive features—the 3½ h.p. water-cooled Scott.

This new mount, which is to be sold purely as a sports model, will carry with it a guarantee of 70 m.p.h. A Sturmey-Archer three-speed gear with close ratios and without kick-starter, forms part of its equipment.

Stand**SCOTT SOCIABLE.**

131. Produced by its makers as a sidecar substitute, but recognised by the definition of the ruling bodies as a cycle car, the Scott Sociable will make its second appearance at Olympia with a minimum of alteration. Attention, however, has been paid to strengthening the shaft transmission and reducing the noise of the bevel gears. Last year the Sociable was introduced to the somewhat staggered public as, perhaps, the most unconventional, yet sound, engineering job ever staged at Olympia. It was only known to a few favoured ones, and to be able to assert that one had driven it was to command wonder and respect. This year many have been on the road, and users are enthusiastic at its linking of sidecar performance with the comfort and silence of the small car.

Stand**EDMUND.**

132. An adjustable spring frame is the feature by which the Edmund is best known; it has hitherto been confined to lightweight models, although obviously perfectly suited for any power. For next year a 4½ h.p. machine will be listed fitted with the new Blackburne engine of that rating. A saddle tank of nice appearance, a Burman gear box, all-chain drive, and internal expanding brakes on both wheels, are salient features of the specification. 293 c.c. J.A.P. and 350 c.c.

Blackburne engines are fitted to the other models, which include a sports type.

The Scott Sociable is attractively unconventional in almost every respect. At last year's Show it was a centre of attraction.

Forecast and Guide to Olympia.—

An all-chain drive 250 c.c. sports model—the Sirrah. A lightweight Burman three-speed gear is fitted.

Stand

SIRRAH AND VERUS.

133. It is impossible simultaneously to build a machine down to a price and up to a quality; and, recognising that the two types appeal to separate sections of the public, Messrs. Alfred Wiseman have introduced "popular" models of their Verus motor cycles under the name of Sirrah. Both makes cover a wide range of types, from the simple two-stroke to a luxurious 5.6 h.p. twin, equally suited to solo or passenger-carrying requirements. The twin Sirrah will be fitted with a 654 c.c. J.A.P. engine, while the corresponding Verus will have a 696 c.c. Blackburne. Saddle tanks and handsome mudguards of ample width are special features, and the aluminium chain cases are noticeably neat. A miniature sports model Verus, employing a 2½ h.p. J.A.P. engine and the highest quality components, will be particularly distinctive in its wheel size—24in. A lightweight (2½ h.p. Blackburne) sidecar outfit is another leading model bearing the Verus transfer.

Stand

MASSEY-ARRAN.

134. If the Massey-Arran had never achieved any other success it would go down in history as the machine on which J. Whalley put up such a lone fight against adversity and all the favourites in the 1921 Junior T.T. Incidentally, Whalley has now joined the staff of the

makers, and will be in attendance at Olympia. Excellent detail work and finish characterise the Massey-Arran products, and for 1922 it is intended to concentrate on the lightweight single-

The only V twin two-stroke on the market—the 5 h.p. Stanger.

cylinder models. A new sports model, equipped with 2½ h.p. o.h.v. Blackburne engine, will prove specially attractive; it is a replica of the above-mentioned T.T. machine.

Stand

OLYMPIC.

135. Either the 293 or 350 c.c. J.A.P. engines will be fitted to the Olympic machine, while a choice of two or three-

A 500 c.c. two stroke sidecar—the Dunelt. The single cylinder engine is inclined and carried in a loop frame.

speed Burman gear or four-speed Juckes gear is provided. The Swan spring fork, which employs enclosed coil and buffer springs between the fork blades, is fitted, and either Amac or Vici carburettors are supplied. Visitors to Olympia should not fail to see the swinging gear box bracket, which provides a simple and positive adjustment for the primary driving chain.

On the same stand, but under another name, is shown the New Courier fitted with Villiers engine, Gosport forks, and either single gear, Burman two-speed gear, or Burman two-speed gear with clutch and kick-starter.

Stand

DUNELT.

136. As sole example of the 500 c.c. single-cylinder air-cooled two-stroke, the Dunelt has proved itself during the past year, and will be staged at Olympia with only minor changes and improvements. Its price, complete with full electric lighting set, sidecar, and spare wheel, will be most attractive. In almost every competition in which it has been entered the Dunelt has distinguished itself, and its performances, in view of the cylinder capacity, have indicated better pulling powers at low speed on hills than are generally shown by four-stroke engines of similar size.

Stand

JUPP.

136a. A newcomer to Olympia will be the tiny Jupp, which embodies many unusual features. Briefly, it may be described as a small open-framed motor cycle, having a comfortable bucket seat and footboards sprung together. In addition, protection from mud and oil is amply provided for. The rear wheel is almost enclosed by protecting panels, and the long spring footboards are met at the front end by wide legshields; the engine also has a partial covering; and the transmission is protected by suitable shields. In the lowest part of the open frame lies a two-speed Burman gear box with clutch and kick-starter, and a 2½ h.p. Liberty two-stroke is set well in front in an inclined position. This little machine forms yet another example of a motor cycle modified to suit the requirements of a lady or of elderly riders.

Stand

STANGER.

137. The Stanger is not an entire novelty, but this year will mark its first appearance in improved form with spring frame at Olympia. It earns the title distinctive on several counts. It is one of the only two multi-cylinder two-strokes on the market, and is the only air-cooled V twin of that type at present on the British market. Apart from

Forecast and Guide to Olympia.—

its originality the Stanger engine appears to be a very nicely designed job generally, and should be equally suited to solo or sidecar work. It is, of course, very simple, and possesses a minimum of working parts; this, in conjunction with the fact that the engine gives the torque effect, and consequent smooth running of four cylinders, should prove a most attractive quality to the discriminating class of rider. Well-tried standard components are used, such as the Amac carburettor and the Sturmey-Archer three-speed gear box. Final drive is by belt, and the frame suspension is controlled by a long laminated leaf spring.

Of symmetrical and compact appearance, this $3\frac{1}{2}$ h.p. electrically-equipped sports model N.U.T. should make a wide appeal.

Front view of the substantially constructed L.S.D.

chair type of sidecar, and believe, in consequence, that the modern style of coach-built sidecar body was with us from the earliest period of the popular attachment. Such is not the case, and to Mead and Deakin, of Tyseley, Birmingham, must be given much of the credit of popu-

larising the present-day underslung coach sidecar; the introduction of their Canoelet (*circa 1912*) inaugurated an epoch. The traditions of this firm will be upheld in 1922, and at Olympia will be exhibited taxi-sidecars, light and heavyweight commercial carriers, and all types of touring sidecars.

at the back and a mudguard attached to the body instead of to the chassis as heretofore.

Stand **N.U.T.**
140. The mediumweight V twin as a solo or light sidecar machine has been the N.U.T. policy for several years now, and the result is a production that in appearance is bettered by none. Chain-driven models are now obtainable, in addition to the final belt machines of last year. Two sizes of J.A.P. engines are offered—the $3\frac{1}{2}$ h.p. (496 c.c.) and the 5 h.p. (678 c.c.) twins—and also a special sports model with the former engine, but with lighter reciprocating parts. In this case a close ratio Sturmey-Archer gear box is fitted.

Another big sports solo mount—the 5-6 h.p. Blackburne-engined Metro-Tyler.

The sporting Canoelets (again prototypes of a now almost universal class) will be provided with locker accommodation

On the Peters motor cycle the tank, engine, and one stay make a triangle to form the "frame."

Stand

PETERS.
141. Certainly most original in appearance and design, the Peters two-stroke will assuredly attract a fair quota of spectators. It is sprung front and rear on simple principles, the actual springs being entirely concealed (the front coil in the steering head). The bulbous tank forms the main member of the frame, and the 347 c.c. engine acts as a down tube. An exhaust pressure system of lubrication, already described in *The Motor Cycle*, is incorporated, and the transmission is by belt over variable pulleys. Lighting is electric, current being supplied by a flywheel magneto.

Stand**METRO-TYLER.**

142. Hitherto, the Metro-Tyler range has been confined to lightweight motor cycles, therefore the introduction of a new 5-6 h.p. twin-cylinder model is of interest. Designed primarily as a solo mount, it has very pleasing outlines, and should be a worthy addition to the range of dual purpose machines now on the market.

The engine fitted is a 5-6 h.p. Blackburne, and the equipment includes

Forecast and Guide to Olympia.—

One of the most symmetrical and compact looking British twin motor cycles is the new 6 h.p. Brough Superior, equipped with the 72 x 90 mm. M.A.G. engine.

three-speed gear box, clutch, kick-starter, and all-chain drive. Quick detachable wheels are a feature, the rear wheel being removable without affecting the adjustment of the chain and foot brake.

Stand

ECONOMIC.

143. Economic Motors specialise in a two-stroke flat twin motor attachment with flywheel magneto, originally designed to be used as a pedal cycle attachment, but this unit, which is now British-made, will be shown fitted to a duplex frame lightweight with chain-cum-belt drive. An *Economic de luxe* attachment will also form part of the exhibit, and will be fitted to a pedal bicycle. It will incorporate the Economic spring drive and lighting from the flywheel magneto. The spring drive is bolted to the rim of the rear wheel, and the initial shocks are taken up by means of suitably arranged springs interposed between the sprocket and its attachment. The standard product of this firm will be a pedal cycle fitted with the unit, having a sprocket attached directly to the spokes of the rear wheel. A tradesman's carrier will be shown fitted with the Economic unit and spring drive to the rear wheel. Quite a novelty will be a simple three-wheeler for one person, fitted with Economic engine and a friction gear.

Stand

BROUGH SUPERIOR.

144. This will be the first appearance of the Brough Superior at Olympia, and it may be safely predicted that the exhibit will claim much attention. As

no attempt has been made to build the machine down to a price the designer has had a free hand to produce a motor cycle without a jarring line from the appearance view-point. Either an o.h.v. or a side-by-side 8 h.p. J.A.P. engine may be fitted, and a close ratio Sturmey gear box is usually specified. Although the machine was originally designed as a fast solo mount, it is not surprising that there is now a considerable demand for it as a sporting passenger outfit, when it is fitted with a light Montgomery sidecar of suitable design. For 1922 a smaller edition of the 8 h.p. machine will be fitted with a 750 c.c. M.A.G. power unit.

Stand

XTRA CARS.

148. The Xtra Car exhibit will be of interest to those who are looking for a cheap three-wheeled monocoque which is economical in up-keep, and with an

An ultra lightweight engine with a flat twin two-stroke—the Economic.

appeal to the man who does not care for a solo motor cycle. It follows motor cycle lines throughout, however, the body having the outline of the average touring sidecar. The whole power unit is carried in a separately sprung frame at the rear of the vehicle, and consists of a 2½ h.p. Villiers engine with flywheel magneto, the engine-shaft sprocket driving two sprockets of different sizes by a single chain which passes over all three. On the sprocket spindles, and attached to the sprockets, are two cork friction pulleys of different sizes, which, by rocking a swinging arm on which they are mounted, may be engaged in turn with the special rim attached to the rear wheel, thus giving two speed ratios. Cooling is effected by the air draught passing underneath the body. As this vehicle is fitted with hood and screen, the driver is completely protected from the elements. Starting is by handle actuating a chain running over a free wheel on the engine-shaft.

Stand

BEAUMONT.

148. Sloping top tube frame, 2½ h.p. Blackburne engine, Brampton forks,

Weather protection is ensured on the novel Xtra car.

and Burman gear box with chain-cum-belt drive are the chief items in the specification of this North-country production. The general lines of the machine are good, and it bears evidence of excellent finish. Another model with chain drive, through a Sturmey box; with the oil tank carried on the saddle tube, will be staged in conjunction with a lightweight sidecar.

Stand

VINDEC.

162. Produced by a firm primarily engaged in the trade as factors, the Vindec machines will be exhibited in the Gallery at the Show. There are two models—an 8 h.p. J.A.P.-engined model and a 2½ h.p. two-stroke of 64 x 70 mm. (226 c.c.). The former machine is on highly-developed but conventional lines, having three-speed Sturmey-Archer gear, chain-cum-belt drive, and interchangeable wheels equipped with 28 x 3 in. tyres. The two-stroke is of interest, in that the transmission is by two chains from the engine to countershaft, and thence by belt to the off side of the back wheel. The chains run over different sized sprockets, and a double dog clutch on the countershaft engages either the high or low gear as desired.

THE MOTOR CYCLE

∴ Folding Road Maps ∴

Specially prepared for the use of motor cyclists.

POCKET SIZE. Maps when folded measure 6½ in. × 3½ in. Size of case complete with maps 6½ in. × 5½ in. Can easily be carried in jacket pocket or valise.

THESE sets of maps are acknowledged to be the best—the handiest and the most compact—yet produced for motor cyclists.

They give all the detail that is necessary, and are strongly mounted on linen to withstand hard wear.

Main roads and secondary roads are distinguished by different rulings, and on the maps of England and

Wales, and Scotland, places with Garages and those with Hotels and Inns are also indicated.

They will be found of great service when planning a tour, or for finding a route while on the road.

The map of London is unique. All the main routes into and out of London are shown in red, while, for the convenience of those who wish to avoid the metropolis, the main roads skirting London are printed in blue.

SET OF THREE.

New A.J.S. Singles and Twins.

Modifications to the Sidecar Outfit, and Extended 2½ h.p. Range.

ONE of the most popular sidecar outfits on the market—the 7 h.p.

A.J.S.—has been modified in one or two important points. Chief of these is the fitting of a shock absorber on the engine shaft. This device consists of a floating sprocket prevented from rotational movement by a face cam splined on to the crankshaft, and held in engagement by a powerful coil spring. Any sudden shock causes the sprocket to ride slightly on the spring-loaded cam. A new front mudguard passes between the fork members, and the valances splay outwards below the head; this guard, while being equally effective, provides a better air flow to the cylinders. Instead of the separate magneto and dynamo the Lucas Magdyno is now standardised, and larger exhaust pipes held by a very ingenious external clamping nut are employed. Further modifications consist of improved roller bearing big ends and fabric inserts in the clutch instead of cork. The seating accommodation of the sidecar has also been slightly changed, the slope of the seat and back rest being modified to give a more

New front mudguards and larger exhaust pipes are the most obvious changes on the 7 h.p. A.J.S.

A standard sports model 2½ h.p. A.J.S. Fitted with kick-starter and footrests, this is an ideal fast touring machine.

natural riding position. The Brooks B600 saddle is, of course, retained, and in the case of the A.J.S. this does not interfere with the fitting of pannier toolbags.

The Improved Light Solo Models.

Solo riders will be charmed with the latest 2½ h.p. A.J.S., which is one of the neatest and best carried-out medium-weight machines that we have examined. It is to be listed in three models, all at the attractive figure of £85. The average solo rider will probably choose the standard sporting model, and this we shall take as a basis for description. The engine (74×81 mm. bore and stroke=348 c.c.) differs little from the already well-known 2½ h.p. side-by-side valve engine. Plain crankshaft bearings are employed, but a double row roller bearing is fitted to the big end. A cast-iron piston, with four narrow piston rings, is used; and, except for details, the cylinder head is a replica of that of the 7 h.p. model. Fol-

lowing A.J.S. practice, the head is held down by a cross-bar and two long bolts, and is stayed to the saddle tube by a clip and bar. Transmission is by chain

throughout, a shock absorber being fitted on the engine-shaft. Three speeds are provided by the countershaft gear box, and a three-plate cork insert clutch is mounted on the gear mainshaft. Contrary to usual practice, a kick-starter is fitted to the standard sports model. Both front and rear brakes are of the internal expanding type, and the rear wheel is easily and quickly detachable without disturbing the brake or chain; 26×2½ in. Dunlop heavy tyres are fitted. The frame is particularly neat and light, and provides a low saddle position well forward of the rear wheel; while another important point lies in the fact that the engine plates are secured to the frame by two bolts to both down and saddle tubes. A very simple and ingenious adjustment is provided for the footrests, the bosses of which are drifted so as to form an internal octagonal star, which may be mounted on the square section cross-bar in a number of positions.

Front suspension is by the latest type of Druid fork, which is particularly interesting, in that it provides a compound action, yet all the springs are carried between the fork blades, so as to be out

A new frame giving lower and more amidsips seating is a feature of the 2½ A.J.S. Excellent mudguards and internal expanding brakes are fitted to the touring model.

Telegrams: "Synonymous (Kensal) London."

Advance Details of 1922 Models.

of the mud and clear of mudguard fittings. This fork is very neat; and we are informed that it is most effective. Both sporting models have high compression engines with rather higher valve life than is employed on the standard touring machine; but, whereas the mudguards on the standard sports model are wide, and fully balanced in front, the front guard of the stripped sports is of the racing type. There is a difference also in the chain guarding, that of the stripped model being less complete. No kick-

starter is fitted to the ultra-sporting type; and, though a carrier is fitted, it may be removed without interfering with mudguard supports. Both these models are capable of well over a mile a minute, and embody all the firm's experience in high-speed touring practice.

The more sedate tourist has not been forgotten, and for him the touring model should be ideal. Similar to the sporting models in essentials, it is fitted with a lower compression engine and lower lift valves, and is a fine machine capable of pulling at low speeds and of taking a light

sidecar anywhere in reason. Rubber-studded aluminium footboards and touring bars are fitted, and the new A.J.S. may be described as a real dual-purpose mount—not too heavy for a solo mount, yet sufficiently powerful and stoutly constructed for sidecar work. The reputation already established by the A.J.S. touring machines, especially in the Six Days Trials, is such that it is only necessary to add that the new models closely follow the firm's standard practice, but embody such improvements and modifications as have been found desirable.

Excelsior Plans.

A Comprehensive Range of Lightweights, Big Singles, and Twins.

A WIDE range of models will be shown by Bayliss, Thomas, and Co., the manufacturers of the well-known Excelsior machines. These vary from the 2½ h.p. Villiers-engined, single-gear motor bicycle, selling at £39 18s., to the 8 h.p. J.A.P.-engined *de luxe* sidecar outfit at £162. Dealing first with the lighter models, the Villiers engine is fitted to three of them; a clutch may be fitted to the single-gear machine already mentioned, or a sporting model may be obtained with two-speed gear clutch and kick-starter. A similar specification is applied to a third model, which, however, is provided with an open frame, and is particularly suitable for riders of the fair sex. This model, by the way, is an exception to the Excelsior rule, in that it is fitted with 24×2½in. wheels.

A Solo Touring Mount.

A very pretty little machine, with sloping top tube and excellent fittings throughout, is the new 2½ h.p. Blackburne-engined model, with three-speed gear, clutch, and kick-starter, and all-chain drive. An internal expanding rear brake is fitted, and the machine will undoubtedly appeal to the sporting rider who requires a go-anywhere machine.

Including the 4½ h.p. big single, all the larger Excelsiors are fitted with Burman gear boxes and 28×3in. tyres. The 4½ h.p. machine is a solidly constructed single, particularly suited for hard work, with a sidecar attached; it is sold solo at £95, or with a well-built sidecar at £125. Unlike the twin-cylinder models, a belt rim brake is fitted to the rear wheel, but in other respects the

Fitted with an 8 h.p. J.A.P. engine and Burman three-speed gear box, this electrically equipped Excelsior model with a fully fitted sidecar is in the front rank of powerful sidecar outfits

specifications differ but little. A 6 h.p. twin J.A.P.-engined Popular model is sold complete with sidecar at £135, or with the new 8 h.p. roller and ball bearing engine at £142. This machine is fitted with all necessities, but differs from the *de luxe* 8 h.p. in that it is not supplied with such luxuries as interchangeable wheels. In the case of the 4½ h.p. and the Popular models, tool boxes have replaced the pannier bags, but the standard arrangement of bags is

still retained on the *de luxe* type. As regards the 8 h.p. *de luxe* machine, there is little to be said, except that it is replete with every modern convenience, and is a remarkably fine example of typically British big twin construction. Chain drive throughout, internal expanding brakes in each wheel, and beautiful finish are among the outstanding features.

CALTHORPE MODELS.

AS pioneers amongst the builders of two-stroke sidecar outfits, it is not surprising to find a 2½ h.p. two-stroke fitted with a three-speed Burman gear amongst the Calthorpe range. This machine is, of course, intended for sidecar work, being fully capable of such duty.

Amongst other interesting machines turned out by the makers are a neat little 2½ h.p. two-stroke with 24×2in. tyres. Single-gear, this genuine lightweight will sell at a most attractive figure. An addition to the range is formed by a 500 c.c. twin J.A.P.-engined machine with Burman three-speed box, which will make an ideal dual purpose mount.

Quite a novelty is the spring seat-pillar fitted. The saddle-pillar floats in the down tube, and is supported by an enclosed spring placed in a tube behind the saddle tube, rebound springs are fitted, and the movement is controlled by a piston working in oil.

An "oversize" single that has had many years' vogue, the 4½ h.p. Excelsior, fitted with a 650 c.c. engine.

Rex-Acme Models.

Dual-purpose and Two-stroke Machines under a Combination of Two Well-known Names.

FOR some time now a 4 h.p. Rex-Acme and sidecar has been distinguishing itself in the most important Midland reliability trials; and this severe testing ground has materially helped to evolve the most business-like dual-purpose mount which will be offered to the public for 1922. Experimental machines of this model have proved successful where others of nearly double the capacity have failed, including a sidecar ascent of the notorious Screw Road in North Wales.

A slightly modified 550 c.c. J.A.P. engine and a three-speed Sturmey gear box are standard components, while the frame design is notable for its solidity. The final drive is by chain to a Rex-Acme shock absorber in the rear sprocket; and light guards only are fitted to both chains.

Mudguarding is efficiently and cleanly carried out, and the $26 \times 2\frac{1}{2}$ in. tyres should prove well up to carrying the quite moderate weight of the machine. Compensating brakes act in dummy belt rims on both wheels, and the pedal for the rear brake provides great leverage, being over 6 in. long. The rear stand is of very light but strong girder design. Footboard, handle-bar, and saddle locations afford a comfortable riding position, while Brampton forks attend to the elimination of vibration from the front wheel. An M-L magneto, Amac carburetter, and Best and Lloyd drip feed are standard.

A handsome sidecar, well sprung fore and aft by the one pair of springs, has

Sturdy and clean design is exemplified on the new 550 c.c. dual-purpose Rex-Acme.

been designed for attachment to this model.

Last year's big twin sidecar outfit has been little altered. A J.A.P. or Blackburne engine and chain or belt final drive are optional. A sidecar taxi, however, will be marketed in conjunction with the makers of the Willowbrook sidecars.

The $2\frac{3}{4}$ h.p. lightweights have been already described in *The Motor Cycle*, but a novelty for this firm is the intro-

duction of a two-stroke lightweight, obtainable with or without a gear box. Standard components are used.

Excepting the big twin models, which embody the well-known spring seat-pillar, fitted for some time now to both the Rex and the Acme machines, a Lycett "spring nose" saddle is a standard fitment throughout the range. This saddle has, after a thorough trial, proved most comfortable in action.

An Ultra Lightweight.

The $1\frac{3}{4}$ h.p. (161 c.c.) Grigg Two-stroke Miniature Motor Bicycle.

THE makers of the Grigg miniature motor bicycle have hitherto specialised on a machine of the scooter type, but they have now adopted a policy which this journal predicted would be-

motor cycle type. A two-speed Sturmey gear box, with clutch and kick-starter, is incorporated, the transmission being by chain and belt. The frame is constructed largely without lugs, the joints being

ports are bridged, so that unpinned piston rings may be used without fear of the ends springing open into the port orifices.

From many points of view the Grigg is a machine laid out on lines of great

A duplex frame miniature two-stroke, the Grigg—a 161 c.c. engine and Sturmey-Archer two-speed gear are fitted.

come general after the first flush of the stand-up scooter boom had subsided.

Although the scooter will not be discontinued, the Grigg Motor and Engineering Co., of Winchester Road, Twickenham, have incorporated the same engine in a simple, low-built duplex frame of

Simple framework is an all-important point on such a design as the Grigg.

welded, and the construction is light. Girderless Druid forks carry the front

of the machine, and 24×2 in. wheels are used, tyres of this size being no doubt ample for a machine of such small engine capacity.

The two-stroke engine of 57×63 mm. bore and stroke is well designed, and has a compression release which connects up with the exhaust system; the cylinder

promise, and the straight tube duplex frame should give strength with lightness, and at the same time permit a saddle position low enough to suit the shortest person. Marketed at a low price, it should be ideal for runabout work, in addition to being capable of long journeys.

The Grigg is certainly of a type deserving encouragement. Having all the handiness of a "scooter," it nevertheless embodies well-tried and approved motor cycle design. The fact that scooters made their riders too conspicuous was frequently overlooked.

Mechanical Lubrication for any Engine.

The Showell Pump for Use with Visible Drip Feed, driven from the Magneto Timing.

A MECHANICAL oil pump, suitable for attachment to existing machines, and driven from the magneto timing wheel, is not an entirely novel device, but E. Showell and Sons, Ltd., of Stirchley, Birmingham, have approached the idea on new lines.

Oil leads connecting tank, pump, drip feed, and crank case.

Obviously the designer of the Showell pump has set out to achieve in the one fitment ease of application, simplicity in construction and action, and low cost of production.

The "business" portion of the Showell equipment is a small cylindrical casting having integral inlet and outlet pipe unions; inside the casting runs a spindle with a small clearance in the bore of the instrument; the spindle has a deep square thread or worm around its circumference, and oil reaching this thread at the inlet orifice is "screwed" along to the outlet pipe, up which it is forced to the visible drip feed on the tank. The pump spindle is rotated by means of a square extension which engages with

Section of the Showell pump showing the simplicity of construction; there is only one moving part which may be driven at either engine or camshaft speed.

a square hole in a special magneto pinion nut, the pump body being mounted upon the magneto-chain cover or timing case.

A regulator for the drip feed is provided. For existing machines the Showell pump may be arranged to work in conjunction with the almost universally fitted semi-automatic hand-operated drip feeds.

The only criticism which might be made is that the functioning of the pump

appears to depend upon a supply of oil from the tank by gravity, and the pressure attained is not likely to be high; possibly this will require a fairly thin oil in winter. However, we have not yet

Clean outline of the Showell mechanical pump; the squared spindle engages with a special magneto sprocket nut.

Drip feed regulator mounted on tank used with the Showell pump.

had this pump under road extended test, and, in actual practice, no difficulty may be experienced on this score.

New Grindlay Sidecars.

Improved Springing and a Very Simple Lightweight Chassis Introduced.

GRINDLAY sidecars have enjoyed an excellent reputation in the past, both the *de luxe* models and the lighter sporting types of distinctive design holding high positions in their respective classes.

For next year several modifications have been made to the existing designs, and one entirely new model (for genuine

lightweight machines) has been introduced. Chassis design in this case is of the simplest, the main frame being U shaped, underslung from a very sturdy axle. The body, supplied in either "sporting" (doorless) or touring shapes, hinges on a single spring in front, and is supported on two C springs in the rear. Complete with wheel and tyre, it weighs

only 80 lb., but one of these models has already survived a severe testing attached to a big twin motor cycle. The price will be approximately £18.

The only alteration to the luxurious *de luxe* model is in the substitution of an upturned quarter-elliptic springing at the front instead of the coils previously used. This form of springing is also incorporated in the touring model, and has been used on the Club for some time.

In appearance the Grindlay sporting sidecar is much improved.

Chassis of the new lightweight model.

A Chain Driven Zenith for 1922.

Three-speed. Clutch and Kick-starter Model, with Bradshaw 500 c.c. Oil-cooled Flat Twin Engine.

AFTER an unwavering and staunch adherence to belt transmission, the Zenith designers have at last followed the popular demand, and will offer an all-chain drive machine in future. Primarily, the new machine is intended as a solo mount, and an attractive one at that.

No doubt the relinquishing of the infinitely variable Gradua gear on even one of the Zenith range has been undertaken with mixed feelings, but we think that Zenith Motors, Ltd., have acted wisely, for nowadays the demand for belt transmission is largely limited to the sporting type of rider, who in these bread and butter times does not form the backbone of the motor cycle movement.

Turning to the machine itself, it will be observed that it closely follows the lines of the Gradua-geared Zenith-Bradshaw already described in these pages.

Straightforward Chain Drive.

The $3\frac{1}{2}$ h.p. oil-cooled Bradshaw engine is held by hangers extending from the bottom horizontal frame tube. Naturally, the chief novelty lies in the chain drive, but the application is conventional, and the gear box is the well tried Sturmey-Archer three-speed pattern, including clutch and kick-starter. The ingenuity of the designer has been cleverly displayed in the disposition of the engine, gear box, and silencer, and the special step bracket made for the attachment of the gear box is an example. In spite of the many difficulties which had to be overcome, the general appearance of the machine is both pleasing and attractive. Great attention has been paid to mudguarding, and the rear guard valances are provided with troughs to keep all drippings away from the chain case and other parts.

Both brakes are applied to the grooves of dummy belt rims, the front being operated by an inverted lever, and the rear by a pedal conveniently placed adjacent to the rear side footrest. Front shields protect the rider's legs, and the

A unique feature of the Zenith with the oil-cooled Bradshaw engine is the fitting of the silencer above the power unit.

The new chain-driven model Bradshaw-engined Zenith, showing the front shields, the width of the front mudguards, and the mud flap protecting the valve gear.

lower ends of these are fastened to a cross-bar, which serves to protect the mechanism of the motor bicycle from damage in the event of a fall.

The engine, which is of $3\frac{1}{2}$ h.p., 68x68 mm. (498 c.c.), is fitted with a Thomson-Bennett magneto and the latest pattern Amac carburetter; and, owing to its excellent system of lubrication, is capable of covering over 2,000 miles on a gallon of oil, while the petrol consumption is stated to be between 90 and a 100 m.p.g.

Unusual Silencer Position.

On inspecting the machine, the observer is immediately struck by the appearance of a large cylindrical component immediately below the tank.

This item is the silencer, which is unusual, in that it is situated above the engine instead of beneath it; lest, however, it is imagined that the proximity of the silencer to the tank and rider's legs will be dangerous and uncomfortable respectively, it must be pointed out that an outer casing completely surrounds the silencer proper, an air space between the two preventing conduction of heat to the exterior.

In addition to the standard model a variation, in the stripped sports category, will be introduced.

Martinsyde 1922 Models.

Detail Frame and Transmission Improvements. Interchangeable Wheels. Dummy Belt Rim Brakes.

IT is chiefly in detail improvements that the 1922 6 h.p. Martinsyde sidecar outfit differs from its predecessor. The 6 h.p. 50° twin-cylinder engine, 70x88 mm. (678 c.c.), with overhead exhaust valves, ball bearing crankshaft and camshafts, and roller bearing big ends, remains unaltered, but the high-speed chain is now enclosed by a cast aluminium chain case, while the rear chain is protected by means of an efficient

guard. So far as the gear box is concerned, the kick-starter mechanism is now entirely enclosed; it is fitted with an arrangement to prevent jamming, and works with surprising smoothness. Particular attention has been paid to mudguarding, 6in. guards being fitted all round. For the coming season 26x3in. interchangeable and detachable wheels will be fitted, with a brake rim fitted to each. The front brake is hand controlled,

while the rear brake is actuated by foot and provided with a ratchet so that the machine may be left unattended on a hill.

The particular model illustrated is not fitted with the latest pattern tank, which will be set across the top tube and secured by concealed fastenings. Electric lighting is supplied, in this particular case from an accumulator.

For 1922, a Millford de Luxe sidecar chassis, with dual tubular side members

Advance Details of 1922 Models.

attached to the motor cycle frame at three points, has been adopted, while the body, which is of Martinsyde's own construction, is mounted on C springs fore and aft. It is provided with a sloping door of ample size, so as to give ease of entry, and at the rear is a spacious locker, which will accommodate three tins of petrol. An excellent screen is provided, while there is also a cover for the body as well as an

efficient hood. In this and other Martinsyde models the finish has been greatly improved in every detail, bright parts being eliminated wherever possible. Practically similar in every detail to the sidecar model just described is the 6 h.p. sports model, but the latest pattern now possesses a kick-starter, and while the top gear ratio of the sidecar machine is $5\frac{1}{2}$ to 1, that of the sports model is 4 to 1.

The $3\frac{1}{2}$ h.p. Martinsyde sports model, which is a small replica of the aforementioned machine, has a 496 c.c. 60×88 mm. engine. In this case, a kick-starter is also provided, and the top gear ratio is $4\frac{1}{2}$ to 1.

We have had considerable road experience with the 6 h.p. Martinsyde sidecar outfit during the present season, both as passenger and driver, and can testify to the efficiency and smooth running of the engine, the behaviour of which is more like an 8 than a 6 h.p.—no doubt the overhead disposition of the exhaust valve is responsible for this.

The manufacturers are Martinsyde, Ltd., Maybury Hill, Woking, Surrey.

The capacious locker of the new Martinsyde sidecar, capable of holding three petrol tins in addition to other oddments, is noticeable.

Several detail improvements have been effected on the machine; the wheels are interchangeable, and both brakes work in dummy belt rims.

Some Sidecar Innovations.

Side-by-side Double-seated Sandum Sidecar Body on a Normal Width Chassis. New Sandum-Easing Windscreen.

SEVERAL innovations for next season, the chief of which is a side-by-side two-seater sidecar body, so constructed that it will fit on to an ordinary chassis, have been introduced by the Sandham Engineering Co., Ltd., of 336, Gray's Inn Road, London, W.C., the makers of Sandum sidecars.

The possibility of the above-mentioned construction is brought about by sinking the footroom below the side members of the chassis and allowing the external lines of the body to overlap slightly. Notwithstanding the apparently restricted space, there is ample leg room for two ordinary persons, and the whole body is

ingeniously carried out. The chassis possesses two duplex side members suitably braced, while the body is slung at the rear on inverted C springs. This chassis, as are all other Sandums which are intended for use with the more powerful machines, has the wheel enclosed. Stub axles are only employed on the

Simple yet pleasing lines characterise both bodywork and chassis of this Sandum model.

A double-seated model in the Sandum range of sidecars.

Advance Details of 1922 Models.

lighter models. A feature of all Sandum sidecars is the use of specially tempered springs, which will not take on a permanent deformation.

(Left) Adjusted for use as a hood—the Sandum-Easting screen. (Right) In its normal position this screen gives exceptional protection.

back of which forms a rubber-covered platform, fitted with suitable beading for luggage, and beneath which is a spacious locker containing an adjustable shelf, is equipped with a Triplex glass screen, cabriolet hood, and a sliding table under the scuttle.

So far as the comfort of the passenger is concerned, a novel and ingenious innovation consists of a V type celluloid screen provided with a sliding clamp on each side, which allows backward and forward movement to the extent of 7½ in. The screen may also be set at any angle, and can be so adjusted as to cover the passenger completely. To remove one side of the screen to allow the passenger to dismount only one wing nut need be unscrewed. This screen is known as the Sandum-Easting, and is marketed in conjunction with Easting Windscreens, Ltd.

Hobart Changes.

All Types of Solo Singles up to 350 c.c. Capacity.

HOBART lightweights for 1922 embody no startling changes, but at the same time several important alterations and additions will be made, so that the range includes practically every type of solo machine with an engine of less than 350 c.c.

Change of Engines.

In future all the two-stroke models will be fitted with Morris engines, which, incidentally, have made some most meritorious performances in one or two of the difficult trials of 1921. With this power unit, the Hobart may be obtained with direct belt drive, a plain two-speed gear box, or a Sturmey-Archer two-speed with clutch and kick-starter. In the latter form it will be sold as an "all on" model, the lighting equipment being a B.T.H. Sparklight.

Next there is a 293 c.c. J.A.P.-engined mount, also with a two-speed Sturmey gear and kick-starter and final belt drive. 26×2½ in. tyres are substituted for the 26×2 in. size on the two-strokes.

Another final belt drive model has a 2½ h.p. (350 c.c.) Blackburne engine, and either a two or lightweight three-speed Sturmey gear box; and at the top of the

One of the neatest of the new Hobart lightweights is fitted with a 2½ h.p. Blackburne engine.

scale there is an all-chain drive 350 c.c. J.A.P.-engined machine, which gives one the impression of being an especially attractive solo mount. Although a two-speed gear box is also optional in this case, we should imagine that the three-speed (Sturmey) model will probably make the greater appeal to the soloist's taste. Such items on the specification as Brampton double vertical spring type

forks, dummy belt rim compensating brakes on both wheels, and a B.T.H. Sparklight ignition and lighting set speak for themselves. A sidecar has been specially designed for this model.

Excepting the last-mentioned, all the models may be fitted with the well-known Hobart spring frame. No alteration has been deemed necessary to this simple and efficient frame.

Girder Construction for Sidecars.

IT is claimed, not without some reason, that, instead of twisting the frame of the motor cycle, to which it is fitted, the Girdex sidecar chassis actually supports and strengthens it.

In this remarkably simple design, two correctly designed pressed steel girders are built up as shown, their ends being joined in the front by an I section member, which then extends upwards to form one of the connections to the cycle, and in the rear by the underslung axle tube. There are four points of connection in all, and, excepting the main front girder, all are adjustable. The chain stay connection incorporates a ball joint to ensure ease of alignment.

It is not difficult to imagine the advantages of this construction. The front girder, which takes the load on to the front down tube, is so held that it must always be parallel with the axle tube,

for to twist it would necessitate bending the main girders.

It is also claimed that the chassis strengthens the motor cycle frame. This may appear to be far-fetched on a cursory consideration, but, nevertheless, merits careful study. The second front connection extends from the steering head to the deepest point of the front girder, and thus any externally caused tendency of the cycle frame to twist would first have to bend the front girder of the sidecar at its strongest point.

Simplicity, light weight and strength are obtained by the girder construction of Girdex chassis

8 h.p. Twin Cylinder Combination, Touring, three-speeds, all-chain drive £145 0 0

Model 8—

8 h.p. Tradesman's Light Combination, special three-speed gear, all-chain drive, ample accommodation .. £147 0 0

New Imperial Model 9

8 h.p. Twin "Sports." Super 998 c.c. engine, special 3-speed gear and clutch, all-chain drive; capable of highest speeds—Solo Model £132 0 0

SPECIAL:—

Backwheel bearings on 8 h.p. models, guaranteed Two Years.

Don't fail to inspect the new and wonderfully efficient All-chain Lightweight Models.

ALL MODELS READY FOR IMMEDIATE DELIVERY

OLYMPIA—STAND 69

NEW IMPERIAL CYCLES, LTD., BIRMINGHAM (Est. over 30 years)

In answering this advertisement it is desirable to mention "The Motor Cycle."

A Big Single Abingdon.

A 4½ h.p. Engine for Heavy Passenger Work.

UNDOUBTEDLY one of the features of the Show will be the increase in the number of big singles. Quite one of the most interesting of these is the 4½ h.p. Abingdon King Dick (85×110 mm. = 624 c.c.). This machine has been designed primarily for heavy passenger work and not essentially for high speeds; thus, we find that simplicity and sturdiness are the main characteristics of the new engine. Side-by-side valves are employed, operated by a single cam, the inlet having a direct lift through a tappet housed in a long cast iron guide, and the exhaust being actuated through a bell crank rocker. There are, therefore, only two gear wheels in the timing case, and these are exceptionally wide so as to ensure quiet running and long life.

Lubrication is effected on the principle introduced by Mr. Blumfield many years

All-chain drive is used on the 4½ h.p. Abingdon King Dick, which is designed specially for sidecar work. Quickly detachable wheels are fitted.

A newly-designed Abingdon King Dick big single of 624 c.c. Observe distinctive arrangement of cooling fins, which do not extend round the inlet valve pocket.

ago—that is to say, that oil is led to a large plain bearing on the timing side, whence it is forced inwards by the action of the crankshaft in conjunction with a spirally grooved bearing. The oil escaping in proximity to the flywheel is caught in a thrower ring and flung by centrifugal force to the big end. This big end, by the way, is a bronze bush of exceptional area.

The driving side of the crankshaft is carried in a very large diameter Skefco bearing, the outer race of which is housed in a steel ring and not in the aluminium of the crank case. A flange on this housing is machined so as to form a double face joint for the oil-tight chain case, and a felt oil gland is provided behind the bearing.

Connecting Rod Design.

An I section connecting rod is split at the small end, and when tightened up grips the centre of a very large diameter hollow gudgeon pin. The piston is of cast iron, having three top rings, the lower ring acting as a scraper, and oil return holes being provided directly to the

gudgeon pin bosses. Floating in the piston bosses, the gudgeon pin is not liable to cause distortion; nevertheless, the sides of the piston are relieved, and oil grooves are provided on the bearing slippers.

Designed for Cool Running.

There is plenty of metal in the cylinder casting, which is well laid out as regards cooling, and the circumferential ribs are joined front and rear to prevent ringing. Incidentally, there are wide air spaces between both ports and the cylinder.

From a short road test, we are able to state that the engine is admirably suited to the purpose for which it is designed, and the heavy flywheels enable it to pull slowly without snatch.

Fitted with a three-speed gear box, clutch, kick-starter, and all chain drive, the frame is a powerful piece of construction, the chain stay lugs in particular being very massive, while the large ball bearing hubs are rendered oil-tight and dustproof by a simple form of packing gland which has proved most effective in service.

A C.A.V. Lighting Dynamo.

Prominent Car Lighting Specialists Introduce Motor Cycle Lighting Equipment.

THE pioneer firm in Great Britain to adapt dynamo electric lighting for motor cars were C. A. Vandervell and Co., Ltd., of Acton, London, W.3, and consequently every confidence can be placed in the experience they have gained over the last sixteen or seventeen years.

They have been a long time in producing a motor cycle lighting set, and their experiments have extended over a considerable period. The new dynamo, which weighs 5½ lb., is cylindrical, and has an overall length of 7½ in. It is designed on conventional lines, regulation of output being effected on the well-known three brush method.

The dynamo begins to generate at 900 r.p.m., but reaches its maximum output at 2,000 r.p.m.; any revolutions in excess of this figure do not affect the

output of current, even up to 5,000 r.p.m. The dynamo contains the minimum amount of material consistent with

its strength, has the armature spindle mounted on ball bearings at each end, a box type brush gear supported on a spider

(Right) The new C.A.V. motor cycle dynamo, with cover removed. (Left) Method of attaching the switchbox on to the top tube.

Advance Details for 1922 Models.

rendering the brushes accessible, and a commutator of ample size. An electromagnetic cut-out is situated on the accumulator box of the sidecar outfit, but when the installation is fitted to a motor bicycle a governor pattern cut-out is fitted to the armature-shaft. The dynamo which is fitted to the motor cycle is intended to be driven off the engine-shaft either by means of a chain or a spring belt. The switch box is so arranged that in the case of a solo mount it is clipped to the top tube, so that the driver looks down upon the face of the ammeter, and the switches are arranged

on the end facing him. In the case of a sidecar, it may be attached either to the side of the body or to the dashboard. The switches are arranged as follows: Charge, all on, and dim. The dimming is effected in the case of a sidecar installation by coupling up the lamps in series, thus reducing the current consumption to about one-half. In the case of a solo outfit, the dimming is effected by means of a resistance.

When a sidecar is used, a special low type battery is employed, which is intended to be placed in the locker under the cushion. The battery is the C.A.V.-Willard type, 6 volts, 30 ampere-hours

Switchboard of the C.A.V. neatly located on the tank.

on a ten-hour rating. It weighs 24 lb. ready for use, is 7½ in. long, 4½ in. broad, and 6½ in. high (total height); for solo machines, the battery may be supplied in the 7, 10, 12, and 15 ampere-hour sizes. The C.A.V.-Willard battery is of special type, possessing rubber separators, the rubber being porous and resilient. These batteries carry a free service guarantee. They also carry a twelve months' guarantee.

Showing alternative sidecar lamp fittings.

New M.A.G. Engines.

Large Range of Lightweight Singles and Medium and Large V Twin Power Units.

NEXT year both 250 c.c. and 300 c.c. single-cylinder M.A.G. engines will be marketed by M.A.G. Engines, Ltd., of Harrow Road, Willesden, London, N.W.10.

It will be remembered that in 1915 the O.K. Junior machines were fitted with a 2½ h.p. M.A.G. single-cylinder engine, many of which are still giving excellent service to-day.

An attractive addition to the M.A.G. range of engines, the 250 c.c. single.

The new engines will follow the general lines of the M.A.G. productions, having overhead inlet valves operated by completely enclosed push rods and rocker gear. The smaller engine (2½ h.p.) has a bore and stroke of 64×77 mm. (248 c.c.), while the dimensions of the larger are 64×92 mm. (296 c.c.).

In addition to these are two large capacity cycle car engines, having cylinders set at 90°. The smaller of these has a bore and stroke of 82×103.5 mm. (1,100 c.c.). It has a large oil sump in which there is an oil pump with two plungers, one of which pumps the oil, while the other distributes it by uncovering the ports, delivering it to the bearings and big ends. Plain bearings are employed throughout. The magneto is fitted to the front of the crank case on a platform integral with the timing gear cover, and a starting handle is provided. On the other side of the crank case a spigot is machined so that a gear box or clutch casing may be attached to it. In the case of this engine, and the still bigger type of 1,488 c.c. capacity (bore and stroke 90×117 mm.), which it resembles in most details, the crankshaft, disc, and pin are machined from the solid, the disc being recessed in and bolted to the flywheel. This method of construction ensures rigidity and elimination of torsional stresses.

With the exception of the models referred to, M.A.G. engines will remain unaltered as to their principal features, but the balance of the 45° twins has been

so altered that the critical period has been raised to a point occurring at speeds which are seldom used.

The following is the range of engines manufactured by this firm: Single-cylinders, 2½ h.p. (248 c.c.), 64×77 mm.; and 2½ h.p. (296 c.c.), 64×92 mm. Twin-cylinders (45°), 4 h.p. (496 c.c.), 64×77 mm.; 5 h.p. (592 c.c.), 64×92 mm.; 6 h.p. (740 c.c.), 72×91 mm.; 8 h.p. (992 c.c.), in both air and water-cooled models

A partly sectioned view of the 6 h.p. M.A.G. engine showing the internal working parts. The magneto is the Scintilla, recently described in *The Motor Cycle*.

THE NORTH LONDON M.C.C. ANNUAL DINNER.

AN innovation which might well receive the consideration of club secretaries was introduced during the prize distribution at the North London Motor Cycling Club annual dinner at Pagani's Restaurant, London, on Saturday last.

Competitors who had received secondary awards in the club's competitions during

the season were given the option of the usual gold and silver medals or useful equivalents in the form of matchboxes, ashtrays, silver spoons, and the like. Needless to say, these latter were much appreciated, since, whilst remaining a record of the achievement, they could also serve a useful purpose.

The proceedings were conducted by Mr. B. Staley, the founder of the club, who presided in the unavoidable absence of the chairman, Mr. G. W. Townshend. A letter of regret was read from the new president, Major Sir Philip Lloyd-Greame, K.B.E., M.C., M.P., whose aid they were most grateful to have obtained.

THE MOTOR CYCLE FILM

A Year's Motor Cycle History—
On the Screen.

GREAT enthusiasm has been shown for *The Motor Cycle* film. Nearly a hundred clubs have made enquiries regarding it, and it is already booked up well into March. No charge is made for the loan of this interesting record of the big events of the year—the only expense we ask the various clubs to bear is its carriage to its next destination—and our wish is that as many motor cyclists as possible should see it during the winter social season.

The film will make a first appearance next week, when it will be shown at the Polytechnic Cinema, Regent Street, W., for the benefit of visitors to the motor cycle show at Olympia. In this case it is being included in the ordinary programme of the house, and will be exhibited twice daily, at 3.30 and 8.30 p.m. Prices of admission are from 1s. 3d. upwards. The Polytechnic Cinema is in the upper part of Regent Street—a few minutes from Oxford Circus.

Immediately the Show is over (December 3rd), the film comes to the Midlands, visiting Coventry, Cheltenham, Gloucester, and Stafford on the following week.

Record of 1921 Events.

The Motor Cycle film is the only complete screen record of the chief motor cycle competitive events of 1921, and includes scenes in the Junior and Senior T.T., the A.C.U. Six Days Trials, and the 500 Miles race at Brooklands. Incidents in the French Grand Prix and the 200 Miles Race at Brooklands arranged by *The Autocar* are included, bringing the total length of the film to just over 2,000ft., which takes approximately forty minutes to run through. The exact time may be varied at the discretion of the operator.

In most cases, where dates have already been booked, the club secretary concerned has made arrangements with his local picture house to show the film either in addition to the ordinary programme or as a special private entertainment. In the former event, complimentary tickets are usually arranged for club members. Many clubs, however, prefer to make the event exclusively their own, and have arranged for the hire or loan of suitable halls, projectors, etc. Some exceedingly successful little social gatherings are expected to result, with a consequent increase of interest in club doings generally.

Readers who are not members of a motor cycle club should watch both the columns of *The Motor*

Keen Anticipation Throughout the Whole of the Club World.

Cycle and their local press for details of how and where the film will be shown in their districts. On this page will be found a list of clubs that have already booked dates; and when possible *The Motor Cycle* will publish more exact details as to *venue*,

etc., from week to week. Clubs in all parts of the British Isles have shown their interest, and already an enquiry has reached us from the Continent.

The following forty-four clubs have now had dates allotted as follows:

Coventry and Warwickshire M.C.	December 5th and 6th.
Cheltenham and District M.C.C.	December 7th.
Gloucester M.C. and L.C.C.	December 8th.
Stafford and District M.C.C.	December 10th.
Princess Mary's Convalescent Centre (Rednal)	December 12th.
West Birmingham M.C.C.	December 13th.
Western M.C.C. (Glasgow)	December 15th, 16th, and 17th.
Worcester and District M.C.C.	December 19th, 20th, and 21st.
York and District M.C.	December 23rd and 24th.
Truro and District M.C. and L.C.C.	December 29th.
Falmouth and District M.C. and L.C.C.	December 30th.
Barrow and District M.C.	January 1st.
Cardiff M.C.C.	January 5th.
Neath and District M.C.	January 6th.
Dewsbury and District M.C.C.	January 9th.
Clitheroe and District M.C.C.	January 11th.
Colne and District M.C.C.	January 12th.
Leeds and District M.C.	January 14th.
University of Liverpool	January 17th.
Liverpool M.C.	January 18th.
Newcastle and District M.C.	January 20th.
Oxford M.C.	January 23rd.
Keighley M.C.	January 25th.
Bradford and District M.C.C.	January 26th.
Peterborough M.C.C.	January 27th.
Newport and County M.C.C.	January 30th.
Stocksbridge and District M.C. and L.C.C.	February 2nd.
Sheffield University M.C.C.	February 3rd.
Cork and District M.C.C.	February 8th.
Middlesbrough and District M.C.	February 11th.
Blyth and District M.C.	February 13th.
Ripon and District M.C.C.	February 14th.
Doncaster and District M.C.C.	February 15th.
Elaina and District M.C.C.	February 22nd.
Eastern Valley M.C.C.	February 23rd.
Gorseinon and District M.C.C.	February 24th.
Brynmaur and District M.C.	February 25th.
Herts M.C. and L.C.C.	February 28th.
Aberdare and District M.C.C.	March 2nd.
Wellingborough, Rushden and District M.C.C.	March 4th.
Birmingham M.C.C.	March 8th.
Central Cornwall M.C.C.	March 11th.
Beith and District M.C.C.	March 17th.
Portsmouth and District M.C. and L.C.C.	March 22nd.

In addition, dates are being "reserved" (pending completion of arrangements) for the following clubs:

Yeovil and District M.C.C.	December 28th.
Anfield Plain and District M.C.	January 21st.
Sheffield and Hallamshire M.C. and L.C.C.	February 1st.
Derby and District M.C.	February 4th.
Leicester and District M.C.	February 17th.
Hull A.C. and L.C.C.	March 15th.
Plymouth and District M.C. and L.C.C.	March 23rd.

Applications or enquiries have also been received from the following:

Glasgow (M.C.C.), Kelso, Marlow, Mansfield, Leinster, Blackpool and Fylde, Lancaster, Morecambe, Chester, Chorlton-cum-Hardy, N.W. London, Essex County and Southend, Cumberland County, Halifax, Kirkby Stephen, Falkirk, Eccles, Kidderminster, Exeter, Larkhill, Levis Athletic, University College of North Wales, Redditch, Standaard (Coventry), Coventry Triangle, Shipley, Wath, and Rotterdam.

Times to Light Lamps.

Nov. 25th	...	4.58 p.m.
" 27th	...	4.56 "
" 29th	...	4.54 "
Dec. 1st	...	4.53 "

Next Thursday.

The special Show report number of *The Motor Cycle*.

The M.C.C. Annual Dinner.

The fifteenth annual dinner of the Motor Cycling Club will be held at the Wharfedale Rooms, Hotel Great Central, on Thursday, December 1st, at 6.30 p.m. A particularly fine musical programme has been arranged in which some of the leading music hall artists will appear.

What shall we See at the Show?

How many eager motor cyclists are asking this question? In four days they can see for themselves, but in the meantime this issue of *The Motor Cycle* will solve the problem, in so far as a solution is available without personal inspection.

Third Army D.R.'s Reunion.

Ex-D.R.'s of the 3rd Army who wish to attend the third annual reunion dinner at the Trocadero on December 2nd should communicate with Mr. Cyril F. Earl, 3, Kildowan Road, Goodmayes, Essex. Those who belonged to "neighbouring" signal companies are also invited this year.

Death of a T.T. Rider.

We regret to record the death, following an accident last week, of Leslie Mitchell, the promising Norton rider, of Oldham. Only twenty-six years of age, Mitchell was connected with Bullough's Motors, Ltd., of Oldham, and a familiar figure in Northern speed events. His riding in last year's T.T. practising was most spectacular. During the war Mitchell served as a flying officer in the R.A.F.

Meeting of A.C.U. Centre Secretaries.

The Auto Cycle Union always rightly regards the annual Motor Cycle Show as providing unique opportunities for social and helpful meetings of its representatives and supporters from all parts of the country. In this connection it should be observed by all concerned that a meeting of Centre secretaries will be held at the Royal Automobile Club, Pall Mall, London, at 5.30 p.m. on Wednesday, the 30th November, which it is hoped all Centre secretaries will be able to attend.

FORECAST AND GUIDE TO THE SHOW.
NEW MODELS.
HOW TO GET TO OLYMPIA.

NEXT THURSDAY

THE MOTOR CYCLE

SHOW REPORT.

A stand-to-stand description of the exhibits Olympia, written and illustrated by "The Motor Cycle" staff, will appear in the next issue. Of enlarged size, this Olympia Show Report Number will be preserved for years to come.

Coloured Cover - 4d.

New Models.

Many further new models are described in this issue.

Will the Two-stroke Grow?

At the present moment there is only one single-cylinder two-stroke of 500 c.c. on the market, but this has already proved its worth, and there is a steady tendency towards increasing cylinder sizes. Amongst the smaller engines two-strokes of 350 c.c. will be common, and a new Connaught exceeds this capacity.

Money Value.

Prices have dropped very appreciably since the last Show, and, considering the present lower purchasing power of the pound, many manufacturers are offering better value than in pre-war days. This fact, together with the reduction in prices of oil, petrol, and tyres, should materially increase the market for the "cheapest form of travel."

New 8 h.p. Outfits.

Several manufacturers are introducing 8 h.p. sidecar outfits for 1922. Among these may be mentioned the B.S.A., Ariel, Bradbury, and F.N.

NOMINALLY FOUR-HORSE POWER.

All sidecar passenger carrying records are broken by this miniature railway train, propelled by a 4 h.p. Douglas motor cycle engine, which serves the Esk Valley during the winter months. Eight adults, three children, and some luggage were piled-on on one occasion.

Rear Lights.

It has been resolved by the R.A.C. to urge the Government to compel all vehicles to carry a rear light.

The Olympia Show.

The Motor Cycle Exhibition opens on Monday next, November 28th, and will continue from 10 a.m. to 10 p.m. throughout the week, closing on Saturday, December 3rd. The price of admission is 2s.

Switching Off Head Lights.

The R.A.C. has passed a resolution urging motorists to discontinue the practice of switching off head lights when meeting other traffic on the open road, on the score of danger.

As is usual just before the Show, there has been considerable activity at Brooklands lately, and several important records were broken last week.

On Thursday H. Le Vack (7-9 Indian) raised the flying kilometre speed to 107 m.p.h., and on the following day improved his own sidecar record by over two miles (speed, 69.08 m.p.h.). In addition he broke eight records. F. B. Halford on the o.h.v. 3½ h.p. Triumph gained four in the 500 c.c. class, including the flying mile at 87.80 m.p.h., and R. N. Judd on a 2½ h.p. Velocette secured the Class A flying kilometre at 71.70 m.p.h. This latter record was previously held by a four-stroke. C. G. Pullin (3½ Douglas sc.) and E. B. Ware (Morgan) also made successful attempts on their class times.

Important Meetings during Show Week.

Friday, November 25th.—B.C.M.C. M.T.U. Banquet.
Monday, November 28th.—B.M.C.R.C. Dinner.
Monday, November 28th-Saturday, December 3rd.—
The Motor Cycle Film at the Polytechnic Cinema, Regent St., W.
Wednesday, November 30th.—A.C.U. Centre Secretaries' Meeting.
Thursday, December 1st.—N.W. London M.C.C. Meet at Olympia.
Thursday, December 1st.—M.C.C. Annual Dinner.
Friday, December 2nd.—Third Army D.R.'s Reunion Dinner.

The Scottish Show.

For the first time motor cycle manufacturers will exhibit at a Scottish show, which will be held at Glasgow in January. The makers of the Connaught, Beardmore-Precision, Barr and Stroud, Douglas, Dunell, Enfield, Indian, Humber, James, Martinsyde, Rover, Norton, A.J.S., Triumph, and Victoria have stands.

Entries for the London-Exeter Run.

Up to the time of going to press, the entries for the London-Exeter-London run, starting from Staines on Boxing Day, amount to ninety-five. The start will take place at 8 p.m. from the Bridge House Hotel, Staines, and an early breakfast will be served at the White Hart Hotel, Salisbury, and breakfast at the de Rougemont Hotel, Exeter. Entries (£2), which close on December 7th, must be sent to Mr. F. T. Bidlake, 84, North End Road, Golders Green, London, N.W.11, but it is now too late for intending entrants who are not members to join the club specially for this event. Sidecar outfits largely predominate among the entries at present received.

IMPORTANT RECORDS BROKEN.**CLASS A. (250 c.c. Solo).**

November 17th, 1921.—R. N. Judd (2½ Velocette):
Flying km. 31.2 sec.=71.70 m.p.h.
Flying mile 51.2 sec.=70.31 m.p.h.
November 18th, 1921.—R. N. Judd (2½ Velocette):
Flying 5-mile .. 4 min. 34.34 sec.=65.61 m.p.h.
Equipment: Shell spirit, Speedwell oil, Dunlop tyres, Binks carburetter, C.A.V. magneto, K.L.G. plugs, and various makes of chains.

During the flying 5-mile record, one lap was recorded at 66.11 m.p.h., being the fastest lap made at Brooklands in the 250 c.c. class.

CLASS C. (500 c.c. Solo).

November 17th, 1921.—F. B. Halford (3½ Triumph):
Flying mile 41.0 sec.=87.80 m.p.h.
Mean speed flying mile .. 42.9 sec.=83.91 m.p.h.
5-mile flying ... 3 min. 40.1 sec.=81.78 m.p.h.
10-mile standing. 7 min. 29.48 sec.=80.09 m.p.h.

CLASS E. (1,000 c.c. Solo).

November 17th, 1921.—H. LE VACK (7-9 Indian):
Flying km. 20.8 sec.=107.55 m.p.h.
Flying mile 53.2 sec.=102.27 m.p.h.
Mean speed flying mile .. 36.4 sec.= 98.90 m.p.h.

CLASS F. (600 c.c. Sidecars).

November 17th, 1921.—C. G. PULLIN (3½ Douglas sc.):
Flying km. 29.0 sec.=77.14 m.p.h.
Equipment: Pratt's spirit, Speedwell oil, E.I.C. magneto, Lodge plugs, Amac carburetter, Hans Renold chains, and Hutchinson tyres.

CLASS G. (1,000 c.c. Sidecar).

November 17th, 1921.—H. LE VACK (7-9 Indian sc.):
Flying km. 25.8 sec.=86.70 m.p.h.
Flying mile 42.4 sec.=84.91 m.p.h.
November 18th, 1921.—H. LE VACK (7-9 Indian sc.):
50 miles 40 min. 47.8 sec.=73.53 m.p.h.
1 hour 69 miles 150 yds.=69.08 m.p.h.
100 miles .. 1 hr. 25 min. 33.24 sec.=70.12 m.p.h.
Flying 5 miles .. 3 miles 49.48 sec.=78.45 m.p.h.
Standing 10 miles 7 min. 54.81 sec.=75.82 m.p.h.
Equipment: Shell spirit, Castrol oil, K.L.G. plugs, Bosch magneto, Schebler carburetter, Coventry chains, and Hutchinson tyres.

CLASS H. (1,100 c.c. Cycle Cars).

November 17th, 1921.—E. B. WARE (Morgan):
Flying km. 26.0 sec.=86.04 m.p.h.
Mean speed flying kilog. .. 27.0 sec.=82.24 m.p.h.

ANNUAL DINNER OF THE YORKSHIRE CENTRE A.C.U.**Important Announcement at Leeds by the Secretary of the Auto Cycle Union.**

IN May, 1920, a preliminary meeting at York resulted in the conception of the idea of a Yorkshire Centre of the A.C.U. In October of the same year eight clubs provisionally organised themselves as a centre; and in January, 1921, nineteen clubs officially formed the Centre, which held its first annual dinner at the Victory Hotel, Leeds, on Saturday last, after a general meeting, which took place in the afternoon.

Having a four-figure membership, the number present (under one hundred) was a little disappointing, several of the clubs in the Centre being unrepresented.

The Centre prize distribution was carried out by Lt.-Col. F. S. Brereton.

C.B.E., who also responded to the toast of "The A.C.U.," proposed by Mr. W. R. Haggas (president of the Yorkshire Centre). "The Centre" was proposed by Mr. T. W. Loughborough (secretary A.C.U.), and response made by Mr. J. N. Longfield (chairman).

In proposing "The Yorkshire Centre," Mr. T. W. Loughborough asked that all motor cyclists should work to spread the motor cycle movement and to endeavour to gather all motor cyclists into the clubs affiliated to the A.C.U., so that a strong representative body may be assured. Only by having a compact and unanimous

front could motor cyclists expect amelioration of certain legal requirements.

Of still wider interest to all motor cyclists was Mr. Loughborough's reference to the cycle car movement. He indicated that it was likely that the small runabout of three or four-wheeled type would ultimately supplant the larger sidecar outfits, and he suggested that now was the time for the A.C.U. to seek from the R.A.C. the right to control and organise the cycle car movement. This would also include the endeavour to obtain more favourable taxation rates for the cycle cars. Machines of this type should be taxed as three-wheelers are, adopting the same weight limit of 8 cwt. as a basis of demarcation. Machines of this class Mr. Loughborough described as "the poor man's motor," and they could only be fostered by a live body, encouraging development, as did the A.C.U.; this type was inadequately covered.

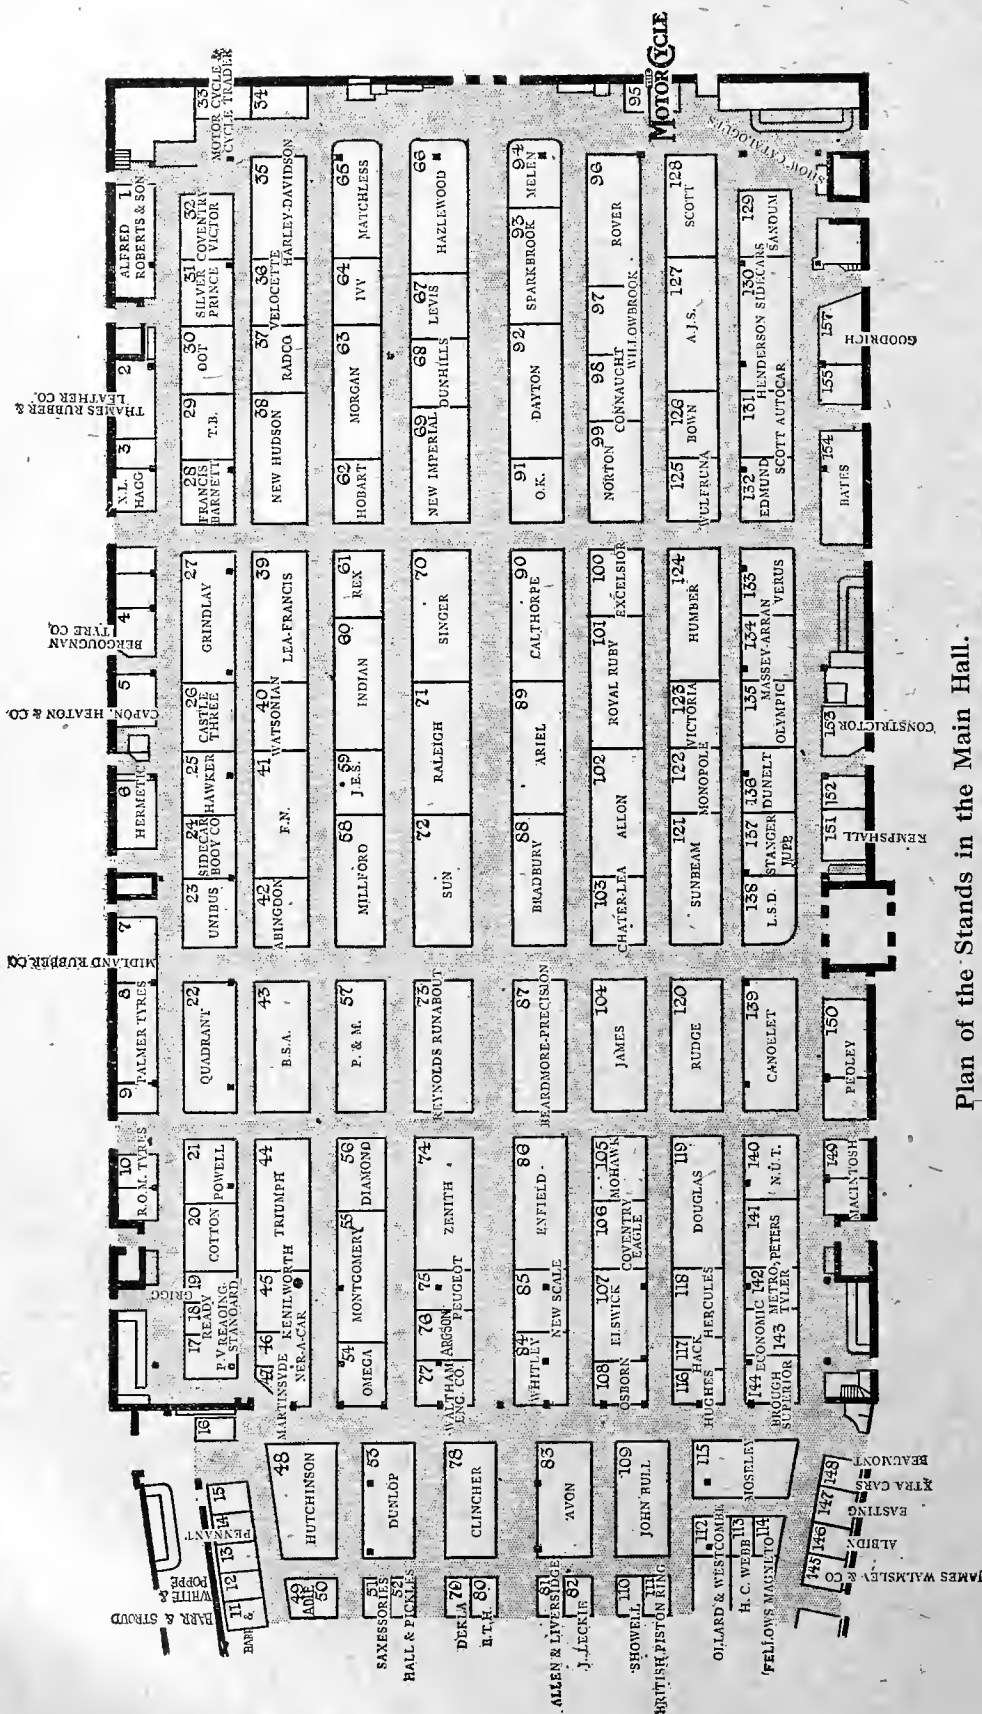

During the course of the evening, the healths of "The Visitors," "The Press," and "The Chairman," were proposed and appropriately responded to. Musical items were provided by the Dewhirst Bros., excellent rag-timers, popular in Northern motor cycle circles.

An impressive moment was when the President called upon the company to stand in silence to the memory of the late L. Mitchell, B. Jefferies, and S. Seal who lost their lives during the pursuit of the sport.

A-de luxe tandem, the latest form of Reynolds runabout, engined with a 2½ h.p. J.A.P. and three-speed Burman gear.

Sidecar or Miniature Car?

A Popular Fallacy exploded. Another Would-be Prophet forecasts the End of Big Sidecars.

WHEN, a decade ago, the cycle car was first exploited there were many who affirmed that the sidecar outfit was doomed. Every year without fail since that time, would-be prophets have expounded the same view, and to-day the now familiar phrases are heard in connection with the new type of miniature car that has so intrigued the lay press. What most fail to recognise is the obvious fact that if cars can be reduced in price, so can motor cycles and sidecars in the same proportion.

The cycle cars of 1912 and the miniature cars of 1922 are totally different propositions. The former were foredoomed by their poor mechanical principles and appearance; the latter may be accepted as road-worthy little vehicles, and as having everything in their favour to be a commercial success. Their prices, too, are low and the value good, and these facts are used to confirm opinions that they will oust the sidecar from its present proud position in public favour.

From the Monetary Point of View.

Because it is possible to obtain a four-wheeler for, say, £250, it is asserted that the big sidecar outfit is no longer justified. Considered purely from the point of view of £ s. d., this view is probably near the truth, but the one important factor—the psychology of the motor cyclist—is often overlooked.

The writer of the motor cycling notes (so called) in *The Daily Mail* has revealed himself as one who is not a motor cyclist at heart. Writing on miniature cars at the last Show he penned these words:

(1.) "Drivers of the most expensive sidecar combinations would do well to visit the motor car Show. They will then see the future in a correct light. No car show has had greater lessons for this type of motor cyclist, and his reflections will be none too happy. Never has his class been so attractively catered for."

(2.) "The development in this direction (small cars) is the greatest we have yet seen, and must have its effect on the big sidecar market. . . . Comparisons, as I have said, will be none too happy for owners who visit the Show, for never has any car show made such an appeal to him, to forego his present vehicle and invest in a 'baby' car."

Why should the motor cyclist's reflections be unhappy if his class was so attractively catered for? Continuing, "A Motor Cyclist" writes:

(3.) "What the makers of the big luxury sidecars are contemplating to meet this rapid cheapening of the miniature car. . . . I do not know, but it will be an amazingly fine sidecar combination to lessen the great impression which the miniature cars at Olympia have made."

(4.) "Only an absolutely biased and prejudiced sidecar owner could visit this show and be content with his machine after seeing such astonishing cheap products as the 7 h.p. Wolseley, the 8 h.p. Rover, the 7.5 h.p. Citroën, the 8 h.p. Talbot, and the Jowett and the Morris-Cowley, to mention but a few."

Before proceeding further with the requiem of the powerful sidecar outfit, let us examine the above statements to see whether they were written after careful and considered thought or inspired by the artificial enthusiasm generated by the Show itself.

We will take paragraph No. 4 first. The prices of the cars mentioned are as follows:

Wolseley	£310	Rover	£220
Citroën	£262	Talbot	£325
Jowett	£250	Morris-Cowley	£299

Not Only a Question of £ s. d.

It will be seen that only the Rover comes anywhere near the price of the most luxurious sidecar outfit. Prices will be about equal, but in the one case the sidecarist will have been extravagant and will glory in his extravagance. He will have absolutely the best in sidecars, while the same money invested in the small four-wheeler will only place him at the foot of another large class. Now the man who will go the limit on a sidecar will not be satisfied on four wheels unless he has something that will place him in a position, in relation to the rest of the car owners, similar to that which he enjoys by being at the top of his class—in owning the most luxurious outfit he can purchase.

That is where the mentality of the motor cyclist influences the question. The low-priced small four-wheelers are far more likely to compete against the slightly more expensive light cars. In other words, the manufacturer who makes both a light car and a miniature will, in some cases, find the latest type living at the expense of the older, which provides an answer to paragraph No. 3. Some motor cyclists will, of course, graduate to the car class; that evolution is constantly taking place, for it has long been recognised that motoring is often a matter of stages. But the average motor cyclist's view is that miniature cars will seriously become competitors of the sidecar when their first cost and running costs are approximately equal. Hitherto many family men have preferred sidecars on account of their greater seating capacity; the sight of heavily laden sidecars is common on our roads to-day.

Not Forgetting the £100 Sidecar.

The Daily Mail writer has forgotten that before the war he had small cars at less than twice the cost of a sidecar outfit. To-day the respective prices are just as far, if not farther, apart. Sidecar prices are falling; popular single-cylinder outfits will next year be marketed in the neighbourhood of £100.

Economy in running costs—the outstanding magnet of the motor cycle—is lost upon our enthusiast.

DAY at the Motor Cycle Show

C. A. VANDERVELL & CO. LTD.

are showing the following Electrical Productions especially applicable to the Motor Cycle world. Many detail improvements have been incorporated for the 1922 Season.

◆ **MAGNETOS.** The famous C.A.V. Magnetos, both light and heavy weight (Types K.U. and 3.U.). Renowned throughout the world as incomparable for reliability and speed. The Magneto with the biggest percentage of records and awards.

◆ **The NEW C.A.V MOTOR-CYCLE DYNAMO LIGHTING SET.** The latest type of machine, built on identically the same lines as the famous C.A.V. Car Lighting Dynamos.

◆ **HEADLAMPS.** The well-known "E.C." model headlamp with universal clip and centre pillar fixing. The "B.C." headlamp for small machines.

◆ **BATTERIES** for solos and combinations. The same construction is used in these motor-cycle batteries as in our car lighting models. Will withstand the roughest use indefinitely.

◆ **ACCESSORIES.** Sidecar and tail-lamps, including the improved streamline model. Sparking Plugs, Dashlamps and Switchboards.

Sidecar or Miniature Car.—

The writer referred to admits that garage and taxes of the miniature car cost more, but actually takes upon himself to express the empty view in italics that *the miniature car wears longer and is greater value second-hand than the sidecar*. Considering that only two of the cars he mentions have been on the road in any numbers, this statement shows the enthusiasm with which he hurried home from Olympia to write his ill-considered notes to motor cyclists. The tone of

the whole contribution suggests that in future *The Daily Mail* motor cycling column will be abandoned in favour of a weekly discourse on miniature cars.

But the ubiquitous sidecar is not yet done with, and many a tour will be enjoyed by its devotees. In saying this, we fully recognise the good qualities of modern small cars, which we are confident will grow in favour, but not necessarily to the exclusion of the economical sidecar outfit, to-day the most popular vehicle on the road.

THE T.T. RENDEZVOUS.

A Further Contribution from the Isle of Man on the Position concerning the T.T. Races.

IN last week's issue of *The Motor Cycle* we made reference to the negotiations between the A.C.U. and the Manx authorities concerning the T.T. races and gave the substance of an interview with the A.C.U. alongside a statement of the position from our Isle of Man correspondent. These statements did not exactly agree, and the paragraph on the London or A.C.U. view is the subject of the following further communication from Douglas. Our correspondent writes:

What are the Real Facts?

"The A.C.U. state that the guarantees promised by the Manx representatives at Leicester have not been made in a concrete form, that the A.C.U. are getting impatient, and that they have told the Manx authorities that they must have definite information before November 30th with regard to steamship facilities and unloading of machines at Douglas, and suchlike detail; which have been so unsatisfactory in the past.

"Now, what are the real facts? Directly the Leicester deputation returned to the Island the Steam Packet Co. wrote to the A.C.U. asking wherein they had been amiss in the matter of steamship communication, as their past letters from the A.C.U. both before and after the last T.T. races expressed satisfaction at the services provided, and particularly at the service provided during the last races during the coal strike. The A.C.U. presumably replied to this letter, because on October 31st last the A.C.U. intimated to their Local Consul in the Island that they had had a satisfactory letter from the Steam Packet Co., and this is again referred to in a letter from Mr. Loughborough dated November 2nd, and from that date to this no further requirement whatever has been asked from the Steam Packet Co.

"The Isle of Man Steam Packet Co., in their letter prior to October 31st, also detailed to the A.C.U. what it proposed to do with regard to embarking facilities at Liverpool.

"With regard to the unloading of machines at Douglas, this matter was set down to come before Tynwald on November 9th, and it came before Tynwald on that date, and Tynwald made a grant of £5,000 for the erection of an electric crane on the Victoria Pier. This was intimated to the A.C.U. the same day, and at the time of *The Motor Cycle* interview with the A.C.U. in London, the officials would know quite well what had been done with regard to the unloading of motor cycles at the Douglas end. In a letter dated November 10th, a date prior to

the interview in London, Mr. Loughborough says, 'The ground is now much clearer. The main questions outstanding now are those of dates and the grant.' Both these points, it is admitted in the Isle of Man, are outstanding, and a long letter on the subject has been addressed to the A.C.U., urging upon them to apply for certain dates for the forthcoming T.T. races in the Island, namely, the Tuesday and Thursday following Whit-Saturday. It may interest the readers of *The Motor Cycle* to know that up to the time of writing, that is, November 17th, the Highway Board has not received any application from the A.C.U. for dates, although they have been repeatedly urged to do so from this end.

"It is true that the A.C.U. did deliver to those in the Island who have been endeavouring to arrange things satisfactorily for them, an ultimatum which expires on November 30th.

Procrastination.

"The opinion held in the Isle of Man, and it is regrettable to have to state it in print, is that certain officials in London belonging to the A.C.U. are not desirous of returning to the Island next year for the T.T. races. They have denied this assertion, but every act which they have done since the Leicester meeting points in the other direction. It would be most regrettable if these matters have to be thrashed out at the A.C.U. General Committee meeting at Bournemouth.

"The A.C.U. have expressed their complete satisfaction at the passing by Tynwald of a declaratory resolution in favour of the races, and with the withdrawal of 'Sad Sunday' and pillion seat restrictions, and also with the withdrawal of the tax on visiting motorists during race time."

THE MIDSHIPMAN MOTOR CYCLIST.

BARTIMEUS, the well-known writer on naval subjects, in an article which recently appeared in the daily press on the subject of midshipmen, states: "Mostly they own motor bicycles, not (as the conservative maintain) because they are the sons of rich *parvenus*, but because things mechanical are bred in their blood. A rough-and-tumble at the heels of a press-gang lieutenant once satisfied the midshipman's craving for excitement; now he seeks it in propelling a 'stink-bike' (every valve, bolt, and gear wheel of which he knows intimately) at grossly illegal speeds over tortuous thoroughfares." We look forward to seeing a number of these sporting young gentlemen in next year's Arbuthnot Trophy Trial.

NEXT YEAR'S TYRE DESIGNS.

A Review of Tyre Makers' Programmes for 1922, and a Forecast of the Tyre Exhibits at the Show.

Avon (Duroolith).

Bates
(All-weather).

Bergougnan
(Non-skid).

Bergougnan
(Herring-bone
pattern).

Clincher
(Dreadnought).

THE present time shows a great improvement in the construction of motor cycle tyres. Riders are beginning to realise that far greater comfort and far greater tyre mileage are obtained if machines are fitted with the largest tyres they can possibly carry; consequently, motor cycle manufacturers are waking up to the fact that they must allow ample clearance, and the tyre makers are producing a variety of over-sizes to meet the demand. Substantial initial outlay on tyres is money well spent; it renders the rider immune from punctures and other troubles for the extent of the average yearly mileage.

The number of patterns of treads is as great as ever, and the variety of their design is quite an interesting study. All tyre makers aim at making their tyres non-skidding, and their efforts to attain this end result in the multiplicity of patterns illustrated in this article.

Avon.

THE AVON INDIA RUBBER CO., LTD., 343-345, EUSTON ROAD, N.W.1. (Stand No. 83).—The chief novelty among various tyres shown by this firm will be a pattern known as the Duroolith, which is claimed by its makers to be a marked advance in motor cycle tyre development, both as regards construction and quality. The tread consists of large lozenges with a groove on each side, and on the edge of each groove are alternate large and small studs. It is to be made in all sizes from 24×2in. to 28×3in., with three and four-ply casings. Other Avon tyres will be the three-ribbed studded and Stonehenge tread pattern in various weights suitable for all types of machines.

Bates.

W. AND A. BATES, LTD., ST. MARY'S MILLS, LEICESTER (Stand No. 154).—Bates tyres are moulded in the inflated shape, and are vulcanised under the tremendous pressure of 1,200 lb. to the square inch; consequently, it is claimed that the tyre is exceedingly difficult to puncture, and if cut the rubber is so responsive that the edges close instead of gaping apart. The tread of this tyre is unconventional, and should prove an efficient non-skid.

Bergougnan.

THE BERGOUGNAN TYRE CO., LTD., 10, SOUTH CRESCENT, STORE STREET, TOTTENHAM COURT ROAD, N.W.1. (Stand No. 4).—This firm favours two patterns of tread—one with a large central groove with lozenge-shaped studs arranged diagonally on each side of it, and the other a herring-bone pattern. These motor cycle covers are suitable for heavy work where great durability is required.

Clincher.

THE NORTH BRITISH CO., LTD., 204, TOTTENHAM COURT ROAD, W. (Stand No. 78).—One feature of interest in Clincher tyres is that the makers state in their booklet that their 28×3in. tyres will fit 28×2½in. rims. The peculiar cross pattern on the Dreadnought tread should make an efficient non-skid, as it is de-

signed to give an adequate resistance at all angles. Another speciality is the popular three-ribbed type, which is extremely resilient. It is made in millimetre sizes to fit 65 mm. rims, which take 700×80 mm. and 26×3in. Yet another form of tyre is known as the Clincher de Luxe, with a tough white tread possessing excellent wear-resisting qualities as well as ample resiliency. It is made in two patterns, heavy and extra heavy.

Dunlop.

THE DUNLOP RUBBER CO., LTD., ASTON CROSS, BIRMINGHAM (Stand No. 53).—The Dunlop Rubber Co. has specially studied the requirements of motor cyclists this year, and, in addition to the ordinary motor cycle tyres, is introducing a series of heavy covers to suit flat base rims, with car type beads and constructed on car lines in the following sizes: 26×2½in., 26×3in., and 28×3in. They are also making Dunlop Magnum tyres to suit the following rims: 650×65 mm., 700×80 mm., and 26×3in. in cord. The Magnum cover consists of large staggered studs, with rows of small studs on the outside.

Goodrich.

THE B.F. GOODRICH CO., LTD., 117-123, GOLDEN LANE, E.C.1 (Stand No. 157).—The peculiarity of the Goodrich tyre lies in the unconventional design of tread, consisting of a series of short ribs intercepted by transverse ribs, while extraordinary resiliency is claimed for this tyre.

Hermetic.

THE SELF-SEALING RUBBER CO., LTD., HERMETIC WORKS, RYLAND STREET, BIRMINGHAM (Stand No. 6).—The Hermetic tread consists of two ribs of Z pattern outside a straight rib. The tread is exceptionally thick and of excellent quality. Another speciality of this firm is the Hermetic tyre protecting band designed to be placed inside the cover. On its exterior are graduated rubber studs. The band is placed inside the tyre casing between the tube and the inside of the cover, and the inflation of the tube presses the band against the tyre casing so that the rubber studs spread and approach each other, leaving a series of small indentations between them; consequently, the band assumes the form of a resilient cushion of air and rubber supporting the tyre against road shocks and stresses. It also serves to protect the inner tube against puncturing agents.

Hutchinson.

ETABLISSEMENTS HUTCHINSON, 70, BASINGHALL STREET, E.C. (Stand No. 48).—Etablissements Hutchinson will always be remembered as a firm which has specially catered for the wants of motor cyclists. Their newest pattern will be a 29×3½in. cover to fit 28×3in. rims, having the new super-stud tread consisting of lozenges and large studs with ribs at the side. This tyre has met with great success after test. Another

Read these Convincing Proofs of Durability and Service:

Rochdale, 20th April, 1921.

I should like to let you know that I have now completed 2,000 miles on my Reading Standard machine I bought from you last August. During this time I have never touched it with a spanner; the engine is a marvel, and is still running splendidly. I still hope to do many more miles before taking the engine down, as it is at present not showing any signs of carbon. I may say I have ridden many machines, but none so easy and comfortable to drive, even over bad roads. Of course, when I say 'no trouble, I am excluding tyres, as I have had one or two punctures.

I remain, yours truly,
(Signed) R. H. T.

Leicester, 3rd June, 1921.

'You will be pleased to know that the Plus One body has caught on with the A.J.S., and customers are enthusiastic about it. You still have one body to supply on order, in addition to the above. Do please let me have them as soon as you possibly can. I can see there is going to be a big demand for them. As I shall be requiring a lot for the A.J.S. chassis, do you not think you could make the body with the piece cut away to allow of the standard A.J.S. torque rod being used? This would be a great improvement, and would save a deal of trouble. Please give this your earnest consideration, I am sure it is worth it.

Yours faithfully,
(Signed) WILL CHAPMAN.

Normanton, 27th January, 1921.

I would like to take this opportunity of saying how pleased I am with the Reading Standard. My machine has been in constant use since May, and has always been thoroughly reliable. My greatest misfortune has been to break a chain. It is indeed surprising how a machine can stand the bad usage that has been the misfortune of this particular bicycle.

(Signed) G. D.

Diss, Norfolk, 6th May, 1921.

I have had one long run, and the whole thing is quite up to my expectations; in fact, I am quite satisfied. My garage people are coachbuilders as well as motor engineers, and the manager has remarked to me that it is a very nicely made thing. It is quite surprising the admirers it calls while out, apart from my own friends being charmed with it. It is a sidecar one can be justly proud of, and I must congratulate you on such a smart, light, compact, and comfortable 2-seater.

Yours faithfully,
(Signed) H. J. I.

London, 6th June, 1921.

As a matter of interest, I may say that during my trip I took four adults including myself up Bouchurch Hill, between Ventnor and Shanklin, with power to spare.

Yours faithfully,
(Signed) C. W. C.

Consett, Co. Durham.

Machine is doing splendidly with load of two adults and three children in hilly district.

(Signed) J. J. S.

Guernsey, 4th October, 1921.

The machine has done very well during the year I have had it. Recently I did a tour of some 500 miles in the South of England. I carried my wife, two children, and myself, tent, eleven blankets, cooking utensils, ground sheet, sheet to cover sidecar and machine, two tyres, and a large bundle of clothes. I had the machine weighed with all on, and it was over 11 cwt. No trouble, except a puncture or two in the back wheel. Camped out several times. I thought it was pretty good carrying the weight it did.

(Signed) MAJOR H. M.

Catalogues from **AGENTS WANTED.**
J. KIRBY, Broadgate, LINCOLN.

new pattern will be the 710×85 mm. to fit 65 mm. rims, and a smaller pattern of the tyre just described. Mention must also be made of the reinforced inner tube used with great success in the T.T. races, and of the wonderful successes on Hutchinson tyres in both T.T. events, and in the 500 miles races at Brooklands.

John Bull.

THE LEICESTER RUBBER CO., LTD., POST OFFICE PLACE, LEICESTER (Stand No. 109).—The pattern of tread favoured by the Leicester Rubber Co. in their popular John Bull tyre will be the ribbed stud, which is claimed to prevent roll and spin. Another speciality of this firm will be the Granby motor cycle tyre, which is built on a heavy three-ply canvas foundation with a tread consisting of large rubber studs and a row of smaller studs on each side. This particular pattern has been proved to be an efficient non-skid.

Kempshall.

THE KEMPSTALL TYRE CO. (OF EUROPE), LTD., 97-98, LONG ACRE, W.C.2 (Stand No. 151).—In addition to the Kempshall non-skid, a new pattern to be seen for the first time at Olympia will be the Premier cord cover, which was used by the P. and M. team on the occasion of winning the team prize in the Six Days Trials. This is the fifth occasion on which Kempshall tyres have been on machines winning the A.C.U. Six Days team prize; the racing Harley-Davidson, the first machine to do 100 m.p.h., was also fitted with Premier Kempshall covers.

Macintosh.

CHARLES MACINTOSH AND CO., LTD., 22-23, JEWIN STREET, E.C.1 (Stand No. 149).—This firm is placing on the market two patterns of treads—one with staggered indentations and projections, and the other with a peculiar Z pattern tread. These are made in all the usual sizes for motor cycles and cycle cars.

Max.

C. CUTHBE AND CO., 37, GREAT EASTERN STREET, E.C.2 (Stand No. 3).—The principal tyre sold by this firm is known as the Max Cycar, which is built on car lines, and consists of longitudinal ribs between which are lozenge-shaped studs forming the design of the tread. These are made in all sizes up to 710×90 mm. An innovation is known as the Cuthbe Elongator, made of Max plastic tread rubber, which presses from the inside into all holes, cuts, and interstices in the cover, while the special fabric reinforces the foundation or casing of the tyre. It vulcanises itself by heat, and eventually becomes part of the tyre. This should have a strong appeal to motor cyclists who wish to economise.

Midland.

THE MIDLAND RUBBER CO., LTD., RYLAND STREET, BIRMINGHAM (Stand No. 7), is specialising in a three-ribbed and a ribbed and studded tyre with a central rib and studs on each side. The Midland covers will be made in all standard sizes, including the old sizes and also oversizes.

Moseley.

DAVID MOSELEY AND SONS, LTD., 19-20, HOLBORN VIADUCT, E.C.1 (Stand No. 115), are chiefly favouring the three-ribbed pattern tyre for high-powered machines and a studded tyre for light-weight motor bicycles. Special attention has been paid in their motor cycle tyres to the shape of the tyre and the construction of the bead, to give, first, easy fitting, and, secondly, accurate attachment of the bead in the clinch of the rim. In the manufacture of these tyres, great attention is paid to the question of resilience.

Palmer.

THE PALMER TYRE, LTD., 119-123, SHAFTESBURY AVENUE, W.C.2 (Stand No. 8).—The Palmer exhibit will consist of two-ply motor cycle tyres in the three-ribbed pattern, which has so long been a speciality of this firm, and the Palmer four-ply motor cycle tyre, which is considerably stouter than the two-ply pattern, but cheaper in price, than the Palmer cord tyre. Among the latter class may be mentioned the Palmer cord extra heavy car pattern motor cycle cover, which is a car tyre in miniature, and has steel staples at the beads. This will be shown in the 28×3in. ribbed and 28×3in. combination patterns for the C.C.2 rim, 700×75 mm. ribbed, and 700×80 mm. made to fit 650×65 mm. rims.

Pedley.

J. PEDLEY AND SON, LTD., OXFORD WORKS, GREAT CHARLES STREET, BIRMINGHAM (Stand No. 150).—This firm is still adhering to the popular three-ribbed pattern, which is shell moulded, but in addition to this it has produced a new heavy studded model, also shell moulded, which should be popular among sidecar owners.

Roberts.

A. ROBERTS AND SON, LTD., DEYKIN'S AVENUE, WITTON, BIRMINGHAM (Stand No. 1-201).—Alfred Roberts and Sons are responsible for the revival of a promising form of tyre construction in the shape of their D.C. or double-clinch motor cycle tyre, the bead of which fits on either side of the clinch of the rim, thus preventing creeping and rolling. It is easily detachable, and stones cannot dent the rim, while the buttress prevents water getting into the beads. Another pattern in which this firm specialises is one with a central rib standing up between two grooves in which there are V-shaped indentations arranged diagonally round the tread—a pattern that prevents sideslip.

Rom.

THE ROM TYRE AND RUBBER CO. (1909), LTD., 35-36, BROOKE STREET, HOLBORN, E.C.1 (Stand No. 10).—In addition to the combination Rom tyre so well known and tried over a number of years, the Rom Tyre Co. is specialising this season in the Polygon pattern tread, which will be all black and constructed of tough and resilient rubber. The tread consists of an inner line of hexagonal studs with ribs at the sides. These will be made in the usual sizes—26×2½in., 650×65 mm., 700×80 mm., and 28×3in.

FORTY-TWO TURNS IN ONE ALPINE PASS.

Sir,—There are forty-two turns on the high road between Martigny and le Forclaz. This is in answer to Mr. Draper's inquiry in *The Motor Cycle* of November 3rd. D.L.G.
Montreux.

HEAD LAMP DIMMING ETIQUETTE.

Sir,—I have found that the simplest and cheapest anti-dazzle device is one's hand. Simply put one hand in front of the head lamp glass as you approach another vehicle. No motor cyclist has the slightest excuse for not dimming his lamps when necessary (unless minus an arm).
Geneva. S. N. TURNER.

WHICH IS THE WORLD'S BEST SOLO MACHINE?

Sir,—I have read the correspondence *re* the "World's Best Motor Cycle" in your columns with interest, and must say it sounds too "Yankee" to say "world's," as, of course, everything best in the world (in the opinion of those people who live across the border) emerges from that country. However, I do not think there is any one best solo machine, but there are quite a few each best suited to the conditions under which it is used.

Take a country like Canada, and you will find on travelling, outside the cities and larger towns, that solo riding is limited to very few roads, because these comprise cart tracks unknown in England, and often so thick with sand that solo riding would be more or less impossible.

Secondly, one has to take the conditions under which machines are ridden, if in a dry country, or one inclined to be wet, or a very hot climate, etc.

Thirdly, one has to consider the particular requirements of the individual rider. Some riders could not handle a fast $3\frac{1}{2}$ h.p. solo mount or larger. Other riders would not be content to use a small lightweight machine. Also, the amount of riding to be done has to be taken into consideration, as the commercial traveller who rides all day long would want a different machine from the speed enthusiast, who only wants a sports model.

So that one can hardly say that any one machine is the "world's best," but there is no doubt that for all-round excellence, alike of finish, power output for its size, and never failing reliability, there is not a single machine that can surpass the 4 h.p. Triumph.

I have been using one in Canada for the past season, and can only repeat a Canadian Harley owner's remarks on seeing me out sixty miles in the bush, "Gee, I never thought one of those could stand our rough roads"—and I was still pushing further afield. The Triumph comes through smiling, and my only breakage has been two spokes in the rear wheel. I consider our English machines have the whole world beaten as regards quality of material and finish, also for pleasing appearance, but my experience has been so far that the Colonial wants a reliable machine, but finish does not matter; it can be painted all over, and as long as it goes must have plenty of power, large tyres, $30 \times 3\frac{1}{2}$ in., electric lighting and electric horn, and must not be over \$400 (£100) nominally as the present rate of exchange goes. One point I forgot to mention is that the drive must be all-chain, as he has no use for belts.

Wishing your paper every success; it is largely read here and liked, and to a certain extent is educating the Canadian motor cycle movement, which at the present time is very Americanised.

AN ENGLISH MOTOR CYCLIST IN CANADA.

Toronto.

Sir,—With reference to the present discussion as to the identity of the "world's best motor cycle," surely some of your correspondents overlook the fact that we are here concerned, not with matters of fact, but with matters of opinion, and, that being so, it is evidently logical to assume that that machine which can most justly lay claim to the title of "best" must be the one which is able to show a preponderance of owners, *i.e.*, people who presumably consider it the best.

I believe that more than half the total number of existing motor cyclists are mounted on Harley-Davidsons, so it would seem that we here have the answer to the riddle.

Mr. Norman Williams speaks of "the appalling splutter of any American V twin, except at fairly high speeds." The word "splutter" is of necessity somewhat indecisive in meaning when applied to anything of a mechanical nature, but, if misfiring is meant, I can assure Mr. Williams that the Schebler—most excellent of all carburettors—can, with a modicum of intelligence, be made to eliminate completely every symptom of "spluttering" from the engine.

London, N.W.1.

HARLEY.

Sir,—Regarding the question of which is the best solo motor cycle, in my opinion there is no machine to come anywhere near the following for comfort and all-round efficiency, viz.: Lea-Francis, Humber, Sunbeam, Douglas, O.K. Junior, Harley-Davidson, Indian, Rudge-Multi, Raleigh, Triumph (1908 model), Zenith, Scott, F.N., A.J.S., B.S.A., James, Enfield, Beardmore-Precision, A.B.C., N.U.T., De Dion, Alldays, Ariel, Bat-Jap, Blackburne, Bradbury, Brough, Calthorpe, Chater-Lea, Clyno, Comaught, Coulson, Coventry Eagle, Coventry Victor, Diamond, Duzmo, Francis-Barnett, Ivy, Motosacoche, New Hudson, Norton, N.S.U., Omega, P. and M., Premier, Quadrant, Rover, Sun, Velocette, Verus, Wolf, Wooler, Ner-a-car, and any others that I have omitted to mention.

NOIX.

Edinburgh.

ACCUMULATORS FOR SERIOUS LIGHTING SERVICE.

Sir,—I notice in your July 14th, 1921, issue in "Ixon's" "Comments," where he says, in speaking of electric lighting sets, "for example, a set which depends on a dry battery or an accumulator minus a dynamo must be designed for a very limited rate of discharge."

Evidently, "Ixon's" opinions of batteries are not very encouraging. On my motor cycle I am using an accumulator only, and it lights the following lamps: Head light (three bulbs, main light, 48 c.p.), dim light (12 c.p.), and light for using when the machine is stationary (2 c.p.), giving about a discharge of six and a half ampères. The main light is a half watt bulb; also spot light (12 c.p.), speedometer (2 c.p.), and tail light (2 c.p.)—another three ampères, giving a total of about ten ampères, besides an occasional four ampères through a horn. I have had this battery for about two years. It has had no attention, except the addition of water and charging, and I get about fifteen to twenty trips of ten miles on one charge. Should "Ixon" disbelieve me, I advise him to purchase a similar battery—a common American one—a six volt fifteen ampère reinforced Willard.

Now, is about ten ampères discharge a "very limited one" for a battery which has to be charged at only one ampère?

Perhaps "Ixon" will say it is foolish to use such heavy lighting equipment; but as the 'bus is a four-cylinder Militaire, weighing close on 5 cwt., he will see that it makes very little difference.

C. KYLE.

New Zealand.

CONNAUGHT

1922

PROGRAMME

IN addition to the many radical improvements aimed at increasing both the efficiency of the machine and the comfort of the rider, we are also exhibiting our

New $3\frac{1}{2}$ h.p. Three-speed All-Chain drive model for heavier work. This model is sold complete with de luxe sidecar, and full equipment for £95 complete.

The $2\frac{3}{4}$ h.p. models now range in price from £45 Solo.

Our complete range of new models will be shown on—

THE MOTOR CYCLE Insurance Policy

Issued by The Autocar Fire and Accident Insurance Company, Ltd.
(Incorporating "The Autocar" Insurance Dept. Established 1904)

COVERING MOTOR CYCLES or CYCLES and SIDECARS—

Used by Owner for private or professional purposes or personal business journeys.

1. THIRD PARTY.

Legal liability up to an unlimited amount, including law costs. Also indemnifying Insured whilst driving any private motor cycle not belonging to him. Defence of any police summons for driving to the danger of the public when an accident as insured is concerned, free of legal costs.

2. **DAMAGE TO CYCLE** by accidental external means. Reasonable repairs may be put in hand at once.

3. **FIRE** including tyres and accessories.

4. **THEFT** including tyres and accessories when machine is stolen. Damage by attempted theft included.

5. TRANSIT

by road, rail, or inland waterway, also short sea journeys to continent, etc.

6. BONUS.

10% reduction off renewal premium if no claim.

EXTRAS.

To extend Policy to cover use by and to indemnify— one additional rider, 33½% extra. Any licensed rider, 50% extra.

Cycle used solo to carry passenger on pillion seat or luggage carrier—50% extra.

ACCIDENTS TO OWNER.

Benefits: Death £250. Loss of two limbs, or sight of both eyes, £250. Loss of one limb or sight of one eye, £125.

Total disablement, limited to 26 weeks each accident. £3 per week. Premium 30/-

Half Benefits—Half Premium

PASSENGER in SIDECAR.

Benefits as for Owner:

Covering any passenger not suffering from physical infirmity, and not less than 17, or more than 55 years of age. Premium 30/-

REDUCTIONS.

To be taken off premiums (A) only.

15% if Insured bears first 50/- of each accident.

20% if Insured bears first £5 of each accident.

ROLLER BEARINGS AND THEIR ACTION.

Sir,—I cannot let the letter from Mr. N. A. Bloomer, in your issue of the 10th inst., pass without writing to point out to him a serious misstatement in his description of the action of a big end roller bearing.

He states, "The crank pin is running at the same number of revolutions per minute as the big end of the connecting rod." This is obviously incorrect, as the connecting rod has no rotary motion at all, but merely oscillates slightly.

In order to visualise the action of the bearing, the outer race attached to the connecting rod may be assumed to remain still and the inner one on the crank pin to rotate at engine speed.

If the diameter of the outer race is twice that of the inner one, the rollers will now roll round the outer race at half engine speed and in the same direction as the engine is rotating. No slip whatever need take place.

A. R. TURNER.

Sir,—Mr. N. A. Bloomer seems to be under some misapprehension as to the working of a roller bearing big end. He states that the crank pin runs at the same number of revolutions per minute as the big end of the connecting rod, but a little consideration will show that the big end of the connecting rod does not revolve relative to the crank pin.

It is true that the entire bearing revolves round the axis of the crankshaft, or flywheels, but this motion may be disregarded, as the bearing would behave in the same way (apart from the effects of centrifugal force, etc.) if we held the big end stationary and revolved the crankshaft round it.

If Mr. Bloomer will construct a model of a big end bearing, using gears instead of plain rollers, crank pin, and outer race, or, in other words, substitute an epicyclic gear for the plain rollers, etc., he will soon convince himself that there need be no slip whatever between any of the parts.

A. A. BEESLEY.

BORE-STROKE RATIO.

Sir,—I have no desire to reawaken the old long v. short stroke controversy, but *The Motor Cycle* of November 10th contains evidence of such a startling conversion that, as the public memory is so short, I cannot refrain from drawing attention to it. The Society for Conversion of the Heathen should really purchase a long stroke engine, preferably one designed about ten years ago.

At the time of the last bore-stroke ratio controversy (1916-1917) a certain eminent designer of square engines was twitted with the fact that he had produced a very successful long stroke 4 h.p. single at the open hill climb at Style Kop on July 17th, 1915. This gentleman took great pains to explain to the writer and the public, *via* the correspondence columns of *The Motor Cycle*, that for motor cycle engine work there was no virtue in the long stroke engine. The number referred to of *The Motor Cycle* contains the first illustrated description of this gentleman's long stroke T.T. motor cycle.

Let us have a revival meeting arranged at an early date, Mr. Editor, please, when we can all hear from the gentleman the story of his conversion.

A. LINDSAY, M.B.

THE FUTURE OF THE THREE-WHEELER.

Sir,—I read with much interest your article on the three-wheeler. You are right; I believe, in deprecating over-elaboration, and your warning is timely. The cycle car developed into the light car, and the light car ceased to appeal to the man of moderate means when it cost £500 or more. Now the light car is again appealing for popularity by greatly reduced prices. The past car-exhibition may come to be known as the "price-cutting Show." Among the exhibits are eighteen cars listed at £250 or less. Of these eight are under £200, and there are three under £150. Few of those under £200 have as yet proved themselves, and some of them will certainly not appeal to the public taste. But if the three-wheeler is to hold its own and supply the acknowledged need of a link between the motor cycle and the less expensive light car, it must cost under £200. There is no doubt that the three-wheeler is simpler, and can therefore be made at less cost than the four-wheeler of the same class. It should not be impossible, therefore, to produce a simple but thoroughly efficient three-wheeler at a cost of £150 or thereabouts. Of course, there are, even of those who decide on a three-wheeler, some who are willing to pay for additional luxury, and the manufacturer should be ready to meet their requirements by offering more luxurious models.

A great deal has been written about the cheap low-powered car, which can jog along the level at 20 m.p.h., and for which an expectant and hitherto disappointed crowd is supposed to be waiting. The people who write of it are those who as yet know not motoring, and who, when they have once tasted its joys, will be the first to complain if their 'bus is left behind by everything else on the road! The three-wheeler must have a fair turn of speed. It must be essentially a light machine, with fair ratio of horse-power to weight. No one who has ridden a motor cycle is content to "potter," and a large number of the patrons of the three-wheeler are motor cyclists, who have come to consider their comfort. Every three-wheeler should be ready to face such trials as the Six Days or the A.C.U. "stock trial," for it must prove that it is able to hold its own in such competitions, not only with the four-wheeler, but with the sidecar over which it holds undoubted advantages as regards comfort and sociability.

H. GEORGE MORGAN.

MATCH-LESS ACETYLENE LIGHTING.

Sir,—I myself have had on my machine for over a month one of the first Moss and White Redilites made, and so far have experienced no trouble. I should like to add that I do not take the precaution to open my lamp front, and the fact that the tail lamp glass was cracked before the lighter was fitted is a testimony that the explosion is not in any way violent, as the glass is still in precisely the same condition.

M. HUGH PALMER.

UNCONVENTIONAL SILENCING.

Sir,—The enclosed sketch is that of a rather unusual silencing apparatus, which I observed on a 3½ h.p. Norton recently. I think this will interest recent correspondents, who seem to think that motor cycles (like little boys) should be "seen, and not heard." The exhaust pipe was of wire bore copper and polished, and at the time I observed it the rider was doing 15 m.p.h., so that whether or not the arrangement, which was very silent, sacrifices any m.p.h. is a matter of doubt.

One way of obtaining silence with an open exhaust pipe. (See accompanying letter.)

ALPHA.
Oxford.

BETTING ON MOTORING EVENTS.

Sir,—I am taking the liberty of forwarding the opinion held by myself and many others on the above subject. I refer, of course, to the betting conducted by "bookies." I think this state of affairs is diametrically opposed to the interests of the motor and motor cycle movement in general. Betting on horses and athletics is bad enough, but on motor races—well! These races, especially on the track, are all in the cause of the movement, while horse races are sordid financial undertakings. It is just as feasible to speculate on experiments conducted in the laboratories. We do not want the sport brought to the questionable level of horse racing, nor do we want the presence of "bookies" at our events. I consider that this matter should be investigated.

Tottenham.

INDIGNANT.

TO HELP TRADE AND DECREASE UNEMPLOYMENT.

Sir,—I am one of those people who are either waiting to see what the Motor Cycle Show brings forth, or else for next spring, before making up my mind to purchase a motor cycle. It has occurred to me, considering how stagnant trade is and how widespread unemployment is, and probably will be for the next few months, that it might help things all round if would-be purchasers could be induced to make up their minds as quickly as possible, and those who do not (like myself) wish for delivery before next spring to make arrangements to pay fully for the machine now, the manufacturer to allow interest on purchase price paid until the date of the mutually agreed time of delivery expires, making the customer an allowance should prices be reduced. In this way many firms could get over some of the slack period, keep men employed, and avoid congested order books in the spring. The purchaser could get the same return on his money as if he left it in the bank, and do his bit in getting trade going.

Chelmsford.

WHY NOT A T.T. FOR BIG TWINS?

Sir,—From time to time I have seen in your journal letters and articles bewailing the inferiority of the British "big twin."

I think I am right in stating that the chief object of the T.T. races is that of engine development.

Why cannot a 1,000 c.c. T.T. be arranged? I, for one, would be only too pleased to see a British "big twin" beat the Americans, who, at present, are having things all their own way.

ZENITH 90 BORE.

Geneva.

FUEL ECONOMY AT THE EXPENSE OF POWER.

Sir,—With regard to a recent correspondent, "SK 696," I placed inside the jet of my 1919 4 h.p. Triumph a short length of a single strand of Bowden cable, then bent it over, and soldered it to the outside of the jet. Result: M.p.g. increased from 50 to 70; maximum speed decreased from 47 to 40 m.p.h., the machine, of course, being ridden solo. With regard to power, I certainly did notice a falling off riding solo, and with a sidecar I had to change gear so frequently that a new jet was fitted, and the other one kept in case the sidecar should be discarded.

R. C. CONSTABLE.

PURCHASE BY INSTALMENTS.

Sir,—As the purchase of a motor cycle by instalments is now becoming a common practice, it might be well for intending purchasers to scrutinise the method of charging interest on the balance due.

The usual method seems to be to demand a certain sum down and the remainder by twelve equal monthly instalments, which include interest varying from 4 to 7½%.

Now, after payment of the first instalment, the sum is a diminishing one, and the interest therefore should diminish.

A. FLEET.

TEN POUNDS DOWN AND TEN SHILLINGS A WEEK.

Sir,—I have been a reader of your paper now for ten years, and have during that time owned two motor cycles. On my discharge from the Army I bought with my gratuity a 1½ h.p. Konkout, and during about six months' ownership spent all my small wages on getting it repaired, and in that time had at least ten miles riding on it. Result: Sold it in pieces for £6, with which I bought a new suit. I then saved up for about fifteen months and bought another machine "in running order" for £17. This has yet to run on the road, but I have bought a licence and spent my income every week since buying it, and would now be glad to take a "tenner" for it. Now to the point. When I sell this machine I shall have a £10 note to spare and perhaps 10s. per week. When will someone step in with a reliable machine about £30, which can be bought on the easiest "easy payment system" without having to let everybody know about one's business by having to get forms filled up? Leeds.

MOTOR CYCLIST ON PAPER.

COMPARATIVE INSURANCE RISKS.

Sir,—I note in a recent issue that a reader writes complaining that he has to pay a higher rate of premium for his 8 h.p. outfit than his neighbour, who owns one of 3½ h.p.

As a member of the insurance profession, I will try, without going into technicalities, to illustrate how and why the premiums differ in cases of this kind. A motor cycle of 8 h.p., generally speaking, covers more ground annually than its brother of less power, and, of course, in this fact alone the risk is greater. Moreover, an 8 h.p. motor cycle is heavier and capable of more speed, and in the event of a collision, the impact, and the resultant damage, is greater.

The primary factor in the calculation of premiums for insurance of motor cycles is the horse-power ratio; and when one realises that the extent of the damage done by any machine in a collision depends chiefly on the speed and the weight of the vehicle, and that both the speed and weight are indicated by the power of the engine, it will be easily seen why horse-power is such an important matter.

As a further example, it will be seen that the man who owns a 2½ h.p. two-stroke, and uses it only for short runs locally, and whose average speed is round about 18 m.p.h., is infinitely a better risk from an insurance point of view than the man who owns an 8 h.p. sidecar outfit, and who travels long distances at an average speed of 25-30 m.p.h.

W. ATTWOOD-EVANS.

REVIVING THE AUTOMATIC INLET VALVE.

Sir,—There is no doubt whatever that the automatic inlet valve was looked upon as dead many years ago by all makers and experts, and the writer is quite prepared to find himself without any support when claiming that an automatic valve can be constructed to give as good results as its mechanically-operated brother. Perhaps it would be best to ask ourselves first if it is worth while? Having given the subject a great deal of deliberation, I unhesitatingly answer "Yes." Let us for the moment agree that, as regards power, output and flexibility, an automatic valve can be made (without complication) to equal the results obtained by the mechanically-operated valve.

We should then be able to wipe out the following: (1.) Inlet cam. (2.) Tappet guides. (3.) Rocking lever and pins. (4.) The noise which emanates from these parts. And, in consequence, we get a much simpler engine.

What do we expect of the mechanically-operated inlet valve? We expect that the mechanism will open the valve just as the pressure in the cylinder becomes less than atmospheric pressure, keep it open whilst there is any tendency to a vacuum, and that it will allow the valve to close as soon as the pressure inside the cylinder is equal to the pressure outside. Now, in view of the fact that the modern motor cycle engine is capable of performing a revolution, say, 6,000 times per minute, and of the unequal expansion or extension of the cylinder in relation to the tappet rods, the writer is of the opinion that a mechanical impossibility is being aimed at, and that the nearest approach to perfect timing that will be obtained will be by a properly constructed automatic valve.

Now, about the disadvantages of the automatic inlet valve, these may be given as follows: (1.) Restriction to incoming charge. (2.) Cotter frequently shearing. (3.) Blow back of carburetter. (4.) Increase of lift owing to cotter gradually shearing.

Those were the disadvantages years gone by, when the automatic valve enjoyed its first life, and when it received little or no consideration beyond strength of spring.

We are now producing a properly constructed automatic inlet valve, in which none of the old (or new) faults exist. By constant trials on the bench and road, the writer's experience of the advantage of the new automatic inlet valve over the mechanically-operated one has created such confidence as to result in the cutting out of the mechanism in our four-stroke model and substituting the new automatic valve. I foresee a great possibility in the near future of the automatic valve becoming a serious rival to its now more popular brother. J. E. SMITH.

[If our correspondent can produce an automatic inlet valve which will provide easy starting and function correctly without causing restriction to the gas flow between speeds of 500 to 5,000 r.p.m., he will have accomplished a most useful work, and we shall be interested to hear further details of this new development.—Ed.]

Books & Maps for Motor Cyclists.

THE NON-PINKING MOTOR SPIRIT

No need to retard the ignition or to throttle down with "Shell."

"PINKING"—that ominous rattling within the cylinder which betrays a labouring and strained engine—can only be stopped by throttling down or *excessively* retarding the ignition, resulting in overheating and loss of power. TRY CHANGING TO "SHELL," the *non-pinking* spirit. A higher compression is possible with "Shell" than with any other petrol, "Shell" Aviation Spirit excepted.

"Shell" Motor Spirit is regularly and scientifically TESTED in a special variable compression research engine, in order that its superiority in power and mileage may be unfailingly maintained.

These tests are carried out under the supervision of well-known scientists in the Testing Laboratories and Works where the famous "tanks" and other machines of war were tested and developed, and where many motor manufacturers send their new units for efficiency tests.

Company, Limited.
Lower Ford St., Coventry.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a 2d. stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 2d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

ENGINE-SHAFT GEARS.

? Will you give me a little guidance regarding a 1920 single gear Norton? I contemplate fitting some sort of gear, as I intend doing light, occasional sidecar work. Of the various makes of gear now on the market, which would suit me best?—The points I have in mind as desirable are cost of upkeep, wearing qualities, robustness, and silence when running normally in top gear. The initial cost and fitting up are not of so great importance, to my mind, as durability.—J.O.M.F.

The makers of your machine have fitted at various times as standard on the direct-driven models both the Philipson pulley and the Bradbury epicyclic two-speed engine-shaft gear. You would find either to be quite satisfactory, but the latter is rather more noisy in the free engine and low gear positions. The Philipson pulley does not give a free engine position, but in action it is practically automatic, and provides a very flexible drive.

REDUCING MECHANICAL NOISES.

? My motor cycle is a 1912 Arno, 83 mm. bore and stroke. The magneto is driven with two intermediate gear wheels, and the ball bearings in the crank case are in good condition, without play. There is a big end steel pin, with two nuts through the flywheels, and a phosphor-bronze bearing of $\frac{1}{8}$ in. diameter. The engine is very noisy, but good otherwise. Would the following benefit in my overhaul: Regrind the cylinder (What is the nearest size I can get standard rings to suit?); fit aluminium or gunmetal piston; convert the magneto drive to chain; increase the size of the crank pin, or fit roller bearings. I have fitted two new valves and rebored the guides.—E.B.

If the piston shows signs of wear, or there is considerable play between piston and cylinder, it would be advisable to have the cylinder reground and a new piston fitted: there would be no difficulty in obtaining 84 mm. piston rings to suit. It would not be advisable to experiment with aluminium or gunmetal pistons if you desire to reduce the noise. A chain drive to the magneto would probably give more silent running. A roller bearing big-end would tend to noisier running, but it might improve the engine to some extent if it can be applied without undue difficulty.

TWIN MISSING ON ONE CYLINDER.

? My 1912 2½ h.p. Douglas sometimes gives trouble in starting, the engine firing on one cylinder only, and sometimes picking up on two and going for a short distance, then missing again, and finally stopping. I might have trouble like this one day, and another day no trouble whatever. The engine will sometimes go for miles with two up without a murmur or any sign of trouble. I have a fairly large jet (I do not know the size), and the engine takes full air and not much gas. I have taken it down, and everything is, or appears to be, in order. I get a spark at the plugs, my induction is not leaking, the valves are all right, and the compression good. It mystifies me, and I seek your advice on the matter.—S.E.J.

Irregular firing on twin-cylinder machines is almost invariably due to air leaks in the induction joints, and we should strongly advise you to check these over. You might make sure of the induction pipe's joints if you cover them with insulation tape. If, however, you are quite certain that the trouble is not due to air leaks, it is possible that the magneto is at fault. Examine the carbon brush holders, and make sure that they do not show any

minute cracks, and also examine the contact breaker and notice whether the contact points separate an equal distance for each cylinder; if they do not, slightly wider adjustment may effect a cure. It would be advisable to find out which cylinder is missing. This, of course, you can do by detaching the sparking plug wires alternatively when the trouble commences.

TUNING FOR ECONOMY.

? (1.) How may I cut down the petrol consumption of my 1920 2½ h.p. single-speed Hobart-Villiers? It is fitted with an Amac two-lever carburetter; at present I am using a 22 jet. The petrol level is at the makers' setting, and I am only getting between 50 and 60 m.p.g. The magneto timing and compression are all right. (2.) Do you think a variable jet would cut down the consumption appreciably?—E.W.R.

(1.) Your questions are too general to be dealt with in a short paragraph. Points to which you should pay special attention are: (a) That the petrol level should be on the low side. (b) That the ignition should be well advanced. (c) That the belt should be tightly adjusted. (2.) A variable jet adapter would be of great assistance in tuning experiments.

GUARDING THE MAIL. Armed motor cyclists escorting the van carrying registered mail in the streets of New York. This protective measure was adopted after a recent highway robbery of mail.

ENGINE-SHAFT AND HUB GEARS.

Could I use the N.S.U. gear in conjunction with an Armstrong hub (provided the latter was left in top gear) or should I have to fit another back wheel? Should I be doing any damage to the Armstrong by using it with the N.S.U.?—J.G.W.

There is no objection to using an N.S.U. gear in conjunction with the Armstrong hub gear. Normally, of course, you can use the latter in its top gear, but you can also use the gears in conjunction, thus getting an extremely low gear when the low ratio of both is in operation at the same time.

CHOKED PETROL SUPPLY.

I have a 1915 Revere, fitted with an Amac two-lever carburetter, the oil supply going through the side of the latter. Up to last year it used to take full air, but during the last few months it will barely take half air, and if I give it more it will start blowing back through the carburetter, and finally stop altogether unless I shut back to half. It only does 40 m.p.g. Is it time to scrap it, or can it be improved?—F.O.S.

The symptoms which you describe are those of partial restriction of the petrol supply. We should imagine this to be caused either by an obstruction in the jet or by the partial choking of the petrol pipe, or of any filters which may be fitted either at the petrol tank or in the carburetter float chamber union. Dismantle the petrol supply system entirely, and thoroughly clean every part, paying particular attention to any of the internal passages in the carburetter itself. It should not be necessary to scrap the machine after only six years' use. Correctly adjusted, the machine should still be capable of many years' excellent service.

EXPERIENCES WANTED.

Readers' replies to questions published under this heading should be sent to the Editor, "The Motor Cycle," Hertford Street, Coventry, when they will be forwarded direct to the querists concerned.

"W.S." (Liverpool).—Best setting of Binks carburetter on 5-6 h.p. Rudge Multi sidecar.

"M.O.G." (Cambridge).—1921 T.B. three-wheeler: Especially reliability, speed, docility in traffic, leg room, stability on grease.

"F.C.A." (Manchester).—3½ h.p. Sunbeam: Accessibility of back wheel, chain adjustments, general running, and expense of upkeep.

"K.S." (Birmingham).—Ner-a-car: Reliability and general experiences.

"F.B." (Cambridge).—1922 Models 2½ h.p. New Imperial, Douglas, or Raleigh: Speed, reliability, climbing, consumption, and comfort.

"P. and M." (Oxford).—Flexekas or Ayrte sleeves on 1920 P. and M. valves, Brampton spring chain for final drive as shock absorber, and if clearance in gear cases.

"W.R.A." (Pontefract).—5-6 h.p. Raleigh: Speed solo or sidecar, general reliability, ease of handling solo, and petrol consumption.

"T.E.M." (Windsor).—1914 or later Connaught: Climbing, reliability, or petrol lubrication.

READERS' REPLIES.

BROKEN SPOKES.

I had the same trouble as "G.M." on my 6 h.p. Rover sidecar, and as fast as I replaced spokes the others would break off against the hub of my back wheel on the brake drum side. The only way I could cure it (9G spokes having failed) was to have the wheel rebuilt on the bad side with 10G butted spokes. I used A.J.S. spokes, the butted portion near the head being heavier and much stronger than the 9G. Incidentally, I never let my clutch in suddenly, or jammed my brakes on, nor let the engine snatch.—W. H. ALEXANDER.

climb (Nice).

OVERSIZE TYRES.

I hope your readers will not be put off fitting 28×3in. tyres on 26×2½in. rims after reading the letter from the Palmer Tyre, Ltd., in your issue of November 10th. An ounce of practice is better than a ton of precept. Any original D.R. will tell you how "oversizes" were snapped up and fitted with success to all machines with 26×2½in. rims in France.

A D.R. friend of mine advised me to fit a 28×3in. Kempshall on the 26×2½in. rear wheel of my 6-7 h.p. Ariel when I was about to start on my last summer holiday tour. I had no difficulty at all in fitting—no creeping, no rolling at corners, no punctures, no re-inflating—and after 800 miles (including Devon and Cornwall) with three up and luggage, the tyre was as fitted, except the pattern of the tread was worn down. That was in July. It is on yet, and has had only (on one occasion) a few additional pumpfuls of air put in since it was fitted. The increase in comfort is wonderful; no rider thinking of fitting 28×3's should hesitate.—T. W. JURY.

After using tyres on cars and motor cycles since 1907 I cordially agree with your editorial reply to a letter from the Palmer Tyre, Ltd. I have found (with many others) that most tyre makers' remarks on the use of their products may be interpreted very liberally.

I have used 28×3in. tyres on 2½in. rims, and find them easier to fit than the 2½in.; the beads go into clinch more easily owing to the circumference of the tyre being greater. I have always found the 2½in. or 2¾in. tyre very tight, and the bead stays in the central hollow of the rim, and is difficult to force outwards.

All tyre makers advise inflation of tyres to an excessive degree, which advice, if followed, only causes discomfort and bursts.—F. O. PARSONS.

In Canada.

At the championship hill-climb of the Hamilton M.C.C. (Ontario), S. Shepherdson, riding a 4 h.p. Triumph, made fastest time in the "40in." capacity class.

A Change of Mount.

Mr. Gerald Browne, who rode a New Scale in the last Junior T.T., will, in future, be associated with the Edmund machines as sales representative in the Midlands and Southern Counties.

British Sidecar Screens in America.

Manufacturing rights for Easting windscreens in the U.S.A. and Canada have been secured by Shillan, Beck and Co., Inc., of New York. Their product is known as the American Easting, and although only introduced two months ago over 500 have been sold already.

Emerson's Equipment.

When J. L. Emerson secured the one and two hour and fifty and hundred mile records on his 3½ h.p. Douglas on the 11th of this month, the following equipment and supplies assisted his efforts: E.I.C. magneto, K.L.G. plugs, Hutchinson tyres, Flexi carburetter, Pratt's spirit, and Wakefield oil.

A Useful Paste Solder.

For small soldering, jobs are better carried out by means of paste solders rather than by the more usual strip solder and copper bit. Bowden nipples and petrol pipe unions are especially in this category. The advantage of the paste solder is that it contains a fluxing material, and will run at low heat—even by a match flame on emergency. A sample and L. and K. paste solder recently tested was very satisfactory. It is made by Livermore and Knight, Ltd., 180, Fleet Street, London, E.C.

For Tyre Repairs.

A member of our staff recently purchased for trial a tin of U-Neat-It, and the test has proved entirely satisfactory. The package consists of two tins soldered together. One contains cement, the other a glutinous rubber-like substance. Procedure: Rasp the puncture, coat with cement, knead in the paste, and blow up the tyre. There is no waiting "until tacky," and it appears to be lasting. It answered well in a gash on a sidecar tyre tread, and is equally good for punctures in the inner tube.

Catalogues Received.

Rudge-Whitworth, Ltd., Coventry. This firm's series of handbooks "Rudge Wrinkles" is added to in number and excellence by a new one dealing primarily with the three-speed gear box and chain transmission. Much information is also included on timing, ball bearing sizes, and balance.

1922 MODELS.

If you have already made your choice, then secure the added value of real and continuous service by placing your order through—

GODFREY'S

If you have not already made your choice, Godfrey's long experience is yours for the asking. An experience not restricted to the mere selling of machines but broadened and widened by a long record of successes on road and track, including two successive victories in the SENIOR TOURIST TROPHY RACE in the ISLE OF MAN.

THE HARPER RUNABOUT

(All main features covered by Patents)

BACKED BY 20 YEARS' ENGINEERING EXPERIENCE.

**NOT A CAMOUFLAGED MOTOR CYCLE, AND
NOTHING LIKE A SCOOTER!**

THIS machine has been designed by, and is produced under the supervision of, Mr. R. O. Harper, who has had 20 years' experience in the design and manufacture of some of the leading makes of cars.

The HARPER RUNABOUT is a real *car-de-luxe*, but miniature in size, initial cost, and upkeep,—can be garaged in your Hall.

Absolutely safe on greasy roads, with the comfort, cleanliness, and ease of control of a car.

Body on graceful lines, substantially built of aluminium, hickory, and ash,—pillion seat for extra passenger, with footrest, which also acts as a stand for jacking up. Speed—35 m.p.h.

The first and only practical vehicle for use anywhere and everywhere, at **below** motor cycle cost, with absolute reliability.

THE HARPER RUNABOUT WILL BE EXHIBITED

during the *OLYMPIA Motor Cycle Show week* at the Showrooms of the London Agents: Messrs. H. B. COOK, LTD., 202, Gt. Portland St., W.1, where we shall be pleased to discuss Agencies for Territories not already covered.

If your thoughts are turning to a small car
you cannot do better than study the pages of

All types of small and economical cars are fully and prominently dealt within 'The Autocar.'

Not only does it give detailed illustrated descriptions of new small cars, and accounts of road tests of both new and established models, but also hints on running and maintenance, costs of running and up-keep, and news of general interest to owners or prospective buyers of light cars.

"Small Car Talk" by "Runabout"
—a special article by a well-known private owner appears each week.

The Leading Motoring Journal

"The Autocar" is the *complete* journal; it embraces every phase and aspect of motoring, dealing in an equally thorough manner with light, medium and large cars, each issue being attractively illustrated.

EVERY FRIDAY 4d.

OF ALL NEWSAGENTS.

PROPRIETORS: ILIFFE & SONS LTD., 20, TUDOR STREET, LONDON, E.C.4.

"IMPY" UNMASKED is the new REX-ACME 4 h.p., 550 c.c., Single-cylinder mount, as illustrated. An ideal dual purpose machine, one of the finest single-cylinder propositions ever placed upon the market. Fast, remarkably powerful, and, without doubt, reliable. It is the first and only single-cylinder passenger combination to climb "The Motor Cycle" Screw Hill in Wales, with passenger, under its own power, although many other machines have tried. It has also other remarkable performances to its credit—a list has been prepared giving details, also full specification and particulars, if you are really interested in climbing ability and motor cycling efficiency.

Write for copy now.

To all those who have already written, "Impy" extends his thanks, and trusts that the desired particulars have been received and proved interesting. A hearty invitation is extended to everyone to visit "Impy"

COMPANY,
CANNON STREET, MANCHESTER.**

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—First 12 words 3/—, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.**, and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue. Advertisements that arrive too late for a particular issue or that are crowded out will automatically be inserted in the following issue unless accompanied by instructions to the contrary.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. Readers who reply to Box No. advertisements are warned against sending remittance through the post except in registered envelopes; in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor. Carriage is to be paid by the buyer, but in the event of no sale each party pays carriage one-way. The seller takes the risk of damage in transit. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, 1/0. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

A.B.C.

1920 A.B.C. equipped, acetylene lighting, horn; £80.—Victor Horsman, 7, Mount Pleasant, Liverpool. [X2555]

AT OLYMPIA

By the courtesy of Messrs. H. Collier and Sons, Ltd., our Representative will be upon the **"Matchless" Stand (No. 65)**, during the Motor Cycle Show next week, and we shall welcome appointments to meet our customers there.

For the coming season we have contracted for all the well-known makes of motor cycles, and are, therefore, in a position to supply the machine of your choice and give early delivery.

To customers requiring a second-hand or shop-soiled motor cycle, our list offers an excellent range to select from, and both new and second-hand machines can be paid for under our "Deferred System" if desired.

INTEGRITY

OLYMPIA SHOW, 1921.

John W. Tollady—to his friends.

DEAR MEN,

It has always been customary for me to ask all our friends who visit the Show to give me a look up whilst they are there, and this year I extend the most cordial invitation to you all to spend a few minutes with me at either the **Enfield** or the **Triumph** Stands, at one of which I shall generally be found. My invitation applies to those old friends of ours who I have met year after year, and of course, equally to those other friends who, so far, I have only met by post.

I shall be prepared, and shall have difficulty, because of my enthusiasm, in preventing myself from talking Motor Cycles; but my principle object in asking you to come along is really—as I think you know—because I wish to thank you for your kindness to me and my firm. From all parts of the country letters of thanks for what we have done have come to us, and I want to tell you how grateful I am to you for the help you have given us, and to prove to you that, as I grow older, I realise more the meaning of the word "friendship."

Many of you know I shall definitely look for you personally, and I know you won't disappoint me; but the more of you that come, the happier I shall be, and the very last thing that will be in my mind will be to introduce or force a sale. It is **you** I want, and your order must go just where you think best.

If we do talk Motor Cycles, I have many interesting things to tell you. Amongst others, about my 1921 stud of Racing Motor Cycles, which is now for sale. The machines include my winning Scott (the first Scott that ever won at Brooklands). I am also prepared to sell a very special Works Sunbeam, capable of touching thereabouts 80 m.p.h., and if someone who will be kind to the machine comes along, I will even dispose of my little Velocette, which, apart from three awards at Brooklands, has a small handful of medals to its credit. Additionally, I can offer a special Velocette that was built for the 1921 Tourist Trophy Race, and I can assure you that if you intend to take up competition work for next season, any one of these machines should carry you home a winner without any special tuning whatever. Anyway, the machines are for sale, and I shall be glad to give you any details at the Show.

Our Agencies for 1922 are cut down considerably, as I intend to offer you the best lines only. The list includes:

ARIEL, B.S.A., DOUGLAS, ENFIELD, HUMBER, MATCHLESS, NORTON, RUDGE, SCOTT, TRIUMPH, and VELOCETTE;

but we shall be able to supply any other make that interests you, and will be happy to advise you impartially regarding any make.

Additionally we are Agents for **BELSIZE-BRADSHAW, CROUCH, ROVER**, and other, Light Cars, and, as you may be considering the purchase of something of this type, my advice and experience are at your disposal, and Exchanges can be arranged if you wish.

Still, the most important point is that you should come and talk to me—and I feel sure you won't disappoint me.

Kind regards to you all.

Yours faithfully,

JOHN W. TOLLADY,

General Manager.

SITUATIONS VACANT.

WANTED, salesman to take charge of depot, must invest.—Box 7,505, c/o *The Motor Cycle*. [9284]

SALESMAN wanted to specialise in Ford cars; also several best English car agencies; first-class opportunity for the right man; South Cheshire.—Apply, time wages and commission required, Chetwood's Forge, Nantwich, Cheshire. [9379]

N Opening Exists on the editorial side of a motor-cycling journal for two junior assistants, aged 20 to 25. It is essential that applicants should have a good knowledge of driving and motor mechanics, and be energetic and enthusiastic. Journalistic experience not essential, but applicants should have the knack of writing or, terse English, and getting hard facts down on paper. Public school and university men given preference. A very moderate salary is offered in the first instance, and it would depend entirely on the man himself as to future prospects. Suitable applicants will be given an appointment on writing to "Editorial," c/o Human Service, 170, Strand, London, W.C.2. [8655]

PALMER'S GARAGE, TOOTING
 The pre-eminent place for disposing of motor cycles.

Will make you a cash offer at sight.
 You will be sure of a good cheque if you sell your machine at Palmer's Garage.

Thousands of men have sold their machines here. Make a speciality of motor cycles in the weekly auction sale every Thursday at 2.

Auction fee for motor cycles under £50 reserve, 5/-; over £50 reserve, 40/-. No garage charge is incurred until 7 days notice is given.

Will collect machines from any London railway station. The auction sale is held every Thursday, commencing 2 p.m.

Sole Address:

PALMER'S GARAGE TOOTING.

Phone— "Palmer's Garage, Tooting."

CHALLENGE
OIL CO. LTD.
STOKE NEWINGTON
LONDON. N.16.

LADIES AND GENTLEMEN,

We claim to have solved the problem regarding Sidecars and the protection of the passenger. This Sidecar is proclaimed the most wonderful and luxurious Sidecar yet produced. Read what "The Motor Cycle" of September 8th, 1921, says: "A really weatherproof Sidecar, neat, simple, practical, and giving all the advantages of the permanent coupé top; also its invisibility when in the down position."

We are now placing upon the market an improved design of the Brookes Patent All-weather-Sidecar Coupé, embodying the same principles, but on more classic lines. This Body is nothing more or less than a luxurious open Sidecar in fine weather, but, in wet weather, can be instantly converted into a totally enclosed Coupé Body, no leather or canvas hood being used. This gives complete protection from rain, wind, and draughts, etc. At the same time allowing of sufficient fresh air by means of adjustable side wings, screen, and a ventilator fitted to the top portion of the head. The whole is finished in first-class coach style, and mounted to a specially designed Mills-Fulford Model De Luxe Chassis, suitable for machines of 5 h.p. and upwards. You will be well advised to make a point of seeing this Sidecar before placing your order elsewhere.

We shall not be at Olympia, but shall be demonstrating in the immediate vicinity, and shall be showing at all the principal Motor Cycle Agents in London.

Price, complete, £65.

For further particulars, apply to your Agent or direct to the Sole Manufacturers and Patentees:

BROOKES & HARRIS,

Are you interested in LIGHT CARS?

Readers of "The Motor Cycle" who are considering the purchase of a small car will find all the information they desire in the pages of

The Autocar

Every Friday. FOURPENCE.

THE AUTOCAR deals with every phase of motoring, and very fully covers the small car movement.

All the known makes of light cars are advertised in "THE AUTOCAR."

Bargains in second-hand light cars are more likely to be secured through "THE AUTOCAR" than any other medium.

Because—

More second-hand light cars are offered for sale in "THE AUTOCAR" than in any other motor journal.

'An Echo of the Scottish Two Days.'

7th Nov., 1921, Edinburgh.

Dear Sirs,

"I wish to express my thanks to you for the S.P.J. variable jet. In my opinion it supplies a long felt want. I have used it on my 1921 3 1/2 Sports Sunbeam, and have found it entirely satisfactory. In a recent reliability trial, I managed 98 m.p.g., combined with faster acceleration and increased power on hills. The instrument is exceedingly well made and is well worth the money."

Yours truly,

SUTTON, POCKLINGTON & CO.,
111, CLERKENWELL ROAD, LONDON, E.C.1.

Revised Edition

(THE TWENTY-SECOND)

or

MOTOR CYCLES

& how to manage them.

The Standard Handbook on the Motor Cycle, its care and management.

MOTOR CYCLES AND HOW TO MANAGE THEM covers every conceivable subject relating to motor cycles, their care and management, and deals with every part of the machine and with all types of machines. It is a complete and reliable treatise on the multifarious matters that concern all motor cycle riders—selection and purchase of a machine, driving, tuning, upkeep, garaging, etc.

The book is plentifully illustrated from photographs and specially prepared line drawings.

Invaluable to the beginner who wishes to understand his machine, and a handy companion to the more advanced rider.

No More Punctures!

You will never again be stranded with a punctured tyre — never again dread bits of glass, flint, and nails, if you fit the **TUBE PROTECTOR**.

The Tube Protector is a flexible layer of thin pieces of hard metal (arranged as in a coat of mail) enclosed in canvas, and fits between the outer cover and the inner tube of your tyre. No matter what sharp matter pierces the outer cover, it cannot penetrate the Tube Protector — cannot possibly pass through to the inner tube.

The Tube Protector is easy to fit, is light in weight, and causes no friction. It allows you to wear down the outer cover to almost nothing. Think of the saving in time, money, labour, and patience.

Ask your dealer to fit **TUBE PROTECTORS** to your motor cycle tyres

The Motor Cycle Show.

AN unqualified success! That is the verdict upon this year's annual Show, for every one of the 265 exhibitors displays something of real interest to the motor cyclist.

A cursory examination of the exhibits indicates in unmistakable fashion that designers are still profitably expending energy to develop the most economical form of motor vehicle. That there is still scope for the designer and the inventor who will look far enough ahead no one will deny, for who can judge the ultimate limits of the motor cycle in an age that has brought the science of engineering to its present high estate? Less than twenty years ago the motor cycle was a vehicle in embryo. To-day at the Olympia Show there are hundreds of machines of such design and quality that the novice, after an hour's tuition regarding the controls, could employ any one of them to take him from one end of this country to the other at a cost of less than a penny per mile.

That this fact is becoming more appreciated every day is evidenced by the enormous increase this year in the number of motor cycles on the roads (approximately 100,000), and if 1922 is not another record year, it will not be on account of lack of interest.

Great Detail Improvements.

As regards the exhibits, the seasoned motor cyclist observes the many indications that attention has been paid to the small, but important, points where 1921 machines could be improved. Refinements in almost every direction are embodied, and what, perhaps, is the most important feature, prices are considerably reduced. Not only is value substantially better than it was a year ago, but the low prices quoted for a large number of really first-class machines are such that a little consideration of facts convinces the buyer that value is even better than it was before the war. £100 for a 4 h.p. sidecar outfit and under £70 for a 2½ h.p. sidecar place the pleasures and conveniences of

the motor cycle within the reach of thousands who never before have been able to purchase.

Every type of engine is exhibited and every size from a little more than 100 c.c. to twelve times the capacity. Valve systems are represented by the conventional poppet type—both at the side of the cylinder and overhead—sleeve valves and rotary valves, not to mention the unnoted examples of valveless engines, while every modern type of cooling system is employed.

Utilitarian and Sporting Mounts.

At Olympia there are motor cycles for every class of rider—the range of types has been extended by the introduction of miniature machines following more or less conventional motor cycle lines, as distinct from the so-called scooter type. A new public will also be attracted by several two-wheelers which differ from standard practice.

These machines include models which have their mechanism entirely enclosed or embody open frames rendering them suitable for the use of either lady or gentleman. Nor is the sporting machine neglected; in fact, no Show has ever contained so many specimens of that type of mount.

From the utilitarian standpoint, there is ample evidence to demonstrate how the modern motor cycle has taken its place as a family vehicle and also in the useful sphere of light delivery.

The workmanship and finish of all exhibits call for general admiration, which is not always inspired entirely by the glitter of Show models—the experienced motor cyclist discriminates between the superficial gloss and the finish he may expect in the production he purchases in the usual way.

Development of the motor cycle for the million proceeds apace, and all interested in the movement should visit Olympia this week and examine for themselves the 1922 models; those who cannot do so will find a fitting substitute in *The Motor Cycle* Show Report contained in this issue, and which has been written after a personal inspection of the exhibits.

The Show—and After.

THE Show is 'always most excellently timed. Just when rain and frost and mud and Arctic weather have momentarily dashed our ardour for the queen of sports, Olympia opens. We rush up to Town, dazzle our eyes on a lot of glittering new 'buses, soak ourselves in unlimited petrol talk with crowds of the boys whom we last met on a freak hill fifty miles from nowhere, decide that the old 'bus really will not do for another season after all; and so home. Then the really strenuous work begins. Simultaneously we have to raise the needful from somewhere; that may mean the exercise of weeks of diplomacy upon papa, or reconciling Matilda to a reduced housekeeping allowance, or persuading the boss that we are worth a great deal more than he has been in the habit of paying us, or selling the family tiara and substituting the products of Ciro. The other half of the "simultaneously" with which this clumsy sentence began is, of course, concerned with the selection of the new machine. There is the Bradshaw-Zenith. There is the Barr and Stroud sleeve valve. There are all the old pals which have already transported us thousands of miles—the potter-buses more comfortable than ever, the hogbuses rather hoggier than before. So the interest gets sharpened up, winter is over almost before it had begun, and the timidiest of us is soon out sampling the thrills of a new jigger on the old familiar roads.

Pour Moi.

EACH year one's ideal specification gets altered or expanded by the experience of the past season. There are four items anent which I personally have taken the most solemn vows this summer. No. 1. I am going to have 3in. tyres (to flatten the bumps, and exorcise punctures). No. 2. I am going to have some form of automatic oiling, and relieve myself of the necessity for watching my speedometer with one eye and a "greeny-yallery" sightglass with the other. No. 3. I am going to have a super-saddle. No. 4. I am going to have electric lighting.

Do not take me too seriously. When it comes to the point, I shall lose my heart to somebody's engine, or quite possibly to the dinky little kink in somebody

else's T.T. handle-bar; and you will meet me on the road about January with board-hard 2¼in. covers, the familiar green stains round an oozy nickelled joint on my tank top, a path-racing push saddle, and several yards of red rubber tubing festooned round my frame tubes. But it is just as well to start with an ideal. By next Monday my ideal will probably have thirteen points like President Wilson's famous manifesto; but the above quartette have been simmering in my brain all this year.

Dead Easy.

AT the car show at the White City last month I met a brother of the pen who momentarily resembled Don Quixote in that he had a rueful countenance. He met my concerned enquiries with the explanation that he had been commissioned to write up the fuel and oil exhibits, and guessed he would have a job to make them interesting. Being by nature friendly, and also an ingenious liar, I offered to accompany him. We arrived at the Shell stand, and half an hour later my friend departed with sheaves of notes and a bursting skull. The exhibit included a model of the Ricardo variable compression single-cylinder engine, on which Shell spirit is tested for pinking. Next to that stood another model, which—between you and me and the printer—I do not believe the stand attendant knew much about. At any rate, it apparently began by heating Shell oil up to 1,000° F., squashing it under a pressure of 35,000 lb. to the square inch, and then testing the *débris*, if any. Round the walls were various models to amuse the children—lorries, aeroplanes, and such like, which apparently only need a penny in the slot to make them rev. furiously. Some stand!

About Tyre Repair Outfits.

A READER wants to know how I carry my French chalk. I do not know. Till last week I mounted a Patchquick outfit in one of the special leather wallets supplied for the purpose, and anchored to my carrier. The Patchquick tin (like several others) is so arranged that the box of chalk is well jammed in position, and cannot disgorge its contents. Unfortunately, like many other riders, I often have to leave my bicycle unattended; and a

new breed of pilferer has come into existence. He knows that a Patchquick outfit is a good thing, and when he sees one of the tiny rectangular leather cases, he opens it, annexes the tin, and departs hotfoot. So at present my Patchquick lives in my side pocket, and I have generally got the wrong coat on when I puncture. (Happy thought: keep a Patchquick tin in *all* my coats.) While I am on the subject, let me recount how I was mending a puncture in my garage, viz., the coalhole, the other day, and chanced to use an extremely ancient Patchquick tin, which had lain there for generations. The patch slid off the tube while I was refitting the cover. Never having struck such an experience before, as soon as I arrived at the car Olympia I went round to interview Mr. Patchquick at his stand, previously arming myself with a club. He told me what we all ought to know. Somewhere about eighteen months after manufacture a chemical action is set up in all rubber solutions which quite undermines their natural glutinosity. I was not aware that aged solution might look perfectly normal, and yet be about as much use as beer for affixing a patch. Moral: renew your tin of solution annually.

Caravans for me.

I DO not think I should buy a super-car if the Editor ever recognises my merit at its proper worth. I should buy a caravan. There is one on the market designed by a person named Eccles. It only weighed 7 cwt., and I should be inclined to try whether my baby Cedros would not tow one, if I was sure that my A.C.U. "get-you-home" chit would apply if the baby bust in the attempt. Four beds. Windows which open. - Automatic brake, which applies itself going down hill—gently on a coasting grade, and Hindenburgly on a freak slope. Cupboards ready-fitted with unbreakable crockery in spring clips. Cost: about that of a good sidecar outfit. Construction: plywood, to which waterproofed canvas is cemented. The joys of touring in it would be intense, but even greater would be my glee at ostentatiously towing it past one or two hotels where I have been overcharged for very indifferent fare. There is one hotel past which I should enjoy towing a whole procession of caravans. Before I die, I *will* make its proprietor's teeth gnash somehow, if I have to bribe the Caravan Club to encircle it for seven days, as the Israelites once encircled the walls of Jericho.

ON THE WORST HILL IN WALES.

Screw Road (the famous North Wales test hill "find" of *The Motor Cycle*) is so steep on the corners that the spectators of the sidecar attempt depicted above did not sit down; they simply leaned against the hillside! Incidentally, the hill is becoming a very popular testing ground for new models.

WHAT THE SHOW REVEALS.

A Review of Modern Tendencies in Motor Cycle Design and Policy, as exemplified by the Exhibits at Olympia.

THOUGH novelty at the Motor Cycle Show is by no means absent, there is possibly less of an unconventional nature at Olympia this week than was revealed at the Car Show. Motor cycle design as a whole has reached a stage of perfection that permits a temporary halt while detail work on engines and frames, works production questions, and general points of convenience are brought into line.

This remark should not be interpreted as implying that there are no important innovations in 1922 models; for the observer will find an abundance of interesting improvements to reward his search. The fact remains, however, that with the exception of a few daring spirits (and there are always advanced thinkers) who have defied convention, progress has taken place chiefly along sound and well-tried lines.

We have to thank the recent industrial depression more than any other cause for this state of affairs, since manufacturers have not been in a position to branch out suddenly along unorthodox lines, and under the conditions existing it is obviously wiser to improve rather than to experiment. It has long been agreed that change for the sake of change is an unsound and undesirable form of progression.

If we exclude the very considerable all-round drop in prices, one may summarise the tendencies for 1922 as:

- (1.) An important increase in the number of big singles for passenger purposes.
- (2.) The introduction of several 8 h.p. machines by manufacturers of 5-6 h.p. machines.
- (3.) Increasing popularity of lightweight motor bicycles.
- (4.) The increasing use of three-speed gear boxes and all-chain drive for lightweights.
- (5.) The employment of miniature two-stroke-engined machines for passenger-carrying purposes.

Features 4 and 5 are, of course, inter-related, but we have now reached the stage when the 350 c.c. engine, fitted with a three-speed gear box, is capable of the speed, hill-climbing, and endurance of most 500 c.c. pre-war machines. Had the lightweight three-speed gear box been developed earlier, this state of affairs might have come to pass at least a year ago, but for some obscure reason it has hitherto been the rule to fit three-speed gears to the larger solo mounts, and to use only two-speed gears in conjunction with the lower-powered engines. Price has certainly been a controlling factor in the matter, but a few far-seeing

manufacturers have already demonstrated that a three-speed lightweight is capable of the required performance, and is cheaper to buy and maintain than a heavier machine with similar transmission.

With regard to the big single: there have, in the past, been so many first-class manufacturers engaged in the production of this type that it has become one of the most popular forms of motor cycle, but the addition of the Sunbeam, P. and M., and Abingdon, and the return of the New Hudson, Precision, and Excelsior have set the seal on the matter.

In addition, two of our best-known engine manufacturers, J. A. Prestwich and Co. (J.A.P.) and Burney and Blackburne, Ltd., have introduced single-cylinder engines of over 500 c.c. for 1922. These power units are found on many new models, which augment the list of big singles on the market.

ENGINES.

Compared with modern car practice, there are but few overhead valve engines, although there are more of this type of engine in the Show than at former exhibitions. It is the opinion of many Brooklands devotees that overhead valves give a 5 m.p.h. advantage when other things are equal.

Every year a number of enthusiasts visit Olympia to learn something of the trend of modern design, and every year a large proportion leaves in a state of "confusion worse confounded." In addition to forming a convenient record of developments which have taken place during 1921, the accompanying article will help the potential purchaser to crystallise his ideas.

What the Show Reveals.—

The increase is largely due to the fact that several motor cycle manufacturers now market models fitted with the $2\frac{3}{4}$ h.p. overhead valve Blackburne engine, which performed so conspicuously in the last T.T. Races. The overhead valve sporting Triumph makes its public *début*, while the Brough Superior (one model of which has an overhead valve engine) is a newcomer to Olympia, but last year's overhead valve N.U.T. has been abandoned in favour of a side valve engine.

It is significant that the two latest models of the Douglas ($3\frac{1}{2}$ h.p. and 6 h.p.) have overhead valves.

Since overhead valve engines are being extensively used for racing purposes, and thereby perfected, it is reasonable to suppose that they may become more usual on standard machines, though, so far, they have not found great favour for touring purposes. Recent events have demonstrated that overhead valve gear is not necessarily unreliable or unduly noisy.

During the year, great improvements have been effected as regards cylinder and piston

cooling, and, generally speaking, the arrangement of ribs and air passages is very much better than at previous Shows. These points, though of considerable importance, are often overlooked by the non-technical buying public; yet it is largely by reason of improved cooling methods that the small engine has been able to some extent to approach the performance of larger capacity engines.

One half of the crank case of the Zenith-Bradshaw removed to show the oil-cooled cylinder barrels and the timing gear.

there are no fins at all of the cylinder.

The cylinder casting of the new $4\frac{1}{4}$ h.p. Sunbeam engine is well worth close examination, the sweep of the inlet and exhaust passages being very easy, which brings the induction and exhaust pipe joints somewhat lower than is usual.

A new design—the C.A.M.—is distinctive as having circumferential fins on a separate head.

Comparatively long-stroke engines are on the increase. Almost without exception the new engines at the Show are of this type, while the detachable head, too, is finding new sponsors.

Among the new engines so constructed are the C.A.M., $4\frac{1}{4}$ h.p. Sunbeam, and Beardmore.

There appears no decided tendency to alter well-established piston practice. Cast iron pistons still hold their former position on all but sporting machines, in which aluminium pistons are used in some cases. Designers, however, are inclined to

favour narrower piston rings, and more roller and ball bearings are being used than hitherto. In this connection, however, it is not without interest that the New Hudson engine has plain bearings throughout.

For the first time we find a sleeve valve engine coming into open and

Very successful in competitions this year, the o.h.v. $2\frac{3}{4}$ h.p. Blackburne will be fitted as standard to several sports models for 1922.

Oil-cooling has now been applied to a 350 c.c. single Bradshaw engine. The clean external appearance is commendable.

Douglas engines form an admirable example of inclined overhead valve gear—a type which has a future.

Details of 1922 Engines at Olympia.

Two exit pipes are used on the silencer of the $4\frac{1}{2}$ h.p. B.S.A., sports model.

On the twin Raleigh the carburettor is fitted immediately in front of the timing case, in which the induction manifold is cast.

This ingenious exhaust pipe fixing has been adopted on the 1922 7 h.p. A.J.S.

A section of the $4\frac{1}{2}$ h.p. Beardmore-Precision is typical of average single-cylinder design, except for the mechanical lubrication, in which it is in advance of the majority.

Finned exhaust pipe and "semi-streamlined" silencer on the $2\frac{1}{2}$ h.p. o.h.v. Coventry-Eagle.

Arrows on this diagram indicate the path of the oil in the sump-lubricated Hawker two-stroke engine.

The crankshaft of the Liberty engine, built up from steel stampings.

(Left) Three rings are fitted above the gudgeon pin, the lower portion of the Abingdon piston being relieved. (Right) Long cast iron tappet guides are employed.

Some valve details of the $2\frac{1}{2}$ h.p. Coventry Eagle.

Timing cover removed from the new $4\frac{1}{2}$ h.p. Beardmore-Precision engine, showing the mechanical oil pump.

What the Show Reveals—

serious competition with the more usual poppet valve type; to wit, the Barr and Stroud single-sleeve engine, which promises to become a worthy rival to existing types on account of its silence and simplicity.

Steady growth in the number of two-stroke engines continues, and, among others, the White and Poppe, Liberty, Omega, and Morris may be mentioned as newcomers. The Dunelt remains the sole example of the 500 c.c. single-cylinder two-stroke, but, having proved its capabilities, it is not unlikely that its lead will be followed by others, especially for passenger work. Another important phase of engine

Part sectional sketch of the Barr and Stroud cylinder head, showing the auxiliary release valve.

design is the Bradshaw oil-cooled engine, of which a complete range is now available.

TRANSMISSION.

All-chain transmission continues its steady progress. In the case of lightweights, this tendency is significant;

Diagram of a new engine and gear unit—the 4½ h.p. Beardmore-Precision.

Sectional view of the only sleeve valve motor cycle engine, the 2½ h.p. Barr and Stroud, demonstrating its simplicity and symmetry.

chain-cum-belt drive has many staunch adherents, whilst a number of firms offer a choice of either form of transmission.

There is a small but clearly defined movement in favour of the adoption of engine and gear units, and, though in most cases the parts are really distinct and separate from each other, being merely carried on common engine plates or brackets, the Beardmore-Precision firm for 1922 has designed a combined gear unit to suit the internal parts of a standard make of proprietary gear box.

We have already recorded the fact that lightweight three-speed gears are becoming

Cylinder head of the four-valve Triumph, which is approximately hemispherical in shape.

increasingly common, to which remark we may add that almost every manufacturer of gears for the trade now lists a gear of this class, whilst many motor cycle manufacturers themselves produce their own gears of this type. Some have close gear ratios when intended for sporting mounts. A novelty, as far as motor cycles are concerned, is the inverted tooth chain gear box exhibited by the Coventry Chain Co.

LUBRICATION.

Year by year more firms are won over in favour of mechanical lubrication, and the present exhibition is no exception to the rule. It is only fair to mention, however, that one firm who last year standardised a mechanical attachment have this year decided to omit it from their specification. Sight-feed drip lubrication is still the most generally adopted method, but the plain hand pump still has influential supporters. On the T.T. model Sunbeam a hand pump replaces the sight drip feed. Two proprietary mechanical pumps are now available, the Best and the Showell.

An addition to the ranks of mechanically lubricated engines: the Beardmore-Precision vane pump (right), and oil regulator (left).

**What the Show Reveals—
FRAMES.**

There is little general change in frame design, the conventional diamond pattern still holding sway, with sundry variations. Most of the exceptions are already well known, but the New Imperial has introduced a neat loop frame, and the Omega employs a wide duplex frame somewhat on the lines of that used on the A.B.C. The Dot and the McKechnie-Coventry Victor are strikingly unusual spring frame designs.

The Peters, hailing from the Isle of Man, has perhaps the most unorthodox form of frame construction, and one which has many points in its favour. In this design, the tank and engine form two sides of a triangle, of which a single tube forms the third side. Undoubtedly, this construction lends itself to

On the Ner-a-car a pressed steel frame embodies the fixed front mudguard shown on the right.

the case of both Excelsior and Omega light models, the tanks are pressed up against the top rail by plates operated by jack screws in special lugs. This fixing is neat, simple, and pro-

vides a large bearing area. On a number of light-weights the tanks are secured by horizontal bolts to the web of the head lug and similarly at the rear.

A few manufacturers of sporting models provide a fork stop to limit the steering lock, and thus prevent the handle-bars from scratching the tank enamel.

WEATHERPROOFING.

A steady improvement in mudguarding is noticeable, and the wide flat guard has made considerable headway. Added to this, many machines are fitted with legshields as part of the standard equipment. There is also

Two tubes and steel pressings form the main portion of the Hagg frame.

One tube, a tank, and an engine form the three sides of a triangle in the Peters design.

A pressed steel tank forms the backbone of the Beardmore-Precision frame.

cheap production, and, if ever the Ford type of motor cycle materialises, it may be somewhat on these lines.

The main frame of the Hagg, too, is interesting, while the Beardmore-Precision is now a thoroughly proved proposition, which, with its new $4\frac{1}{4}$ h.p. engine, will appeal to a larger section of the public.

As an example of the complete elimination of tubular construction, the Ner-a-car deserves examination, for here automobile practice is clearly followed.

Several new types of spring frames are shown, notably the Peters and Hagg. The concealed front spring, contained within the steering head of the former, is extremely ingenious.

Steel lugs are much more common, and the Beardmore and new proprietary frame unit have no cast lugs in the whole frame construction.

Saddle tanks are popular, but tank fittings remain much as usual. There are, however, two instances of a new type of fixing. In

a tendency towards weatherproofing, which may cause a complete change from the conventional diamond frame. The Hagg, Omega, and Reynolds are noticeable examples of frames designed purely from this standpoint.

IGNITION AND LIGHTING.

Magnetos still hold their sway, but, as far as two-stroke engines are concerned, their supremacy is challenged by the flywheel type of magneto, which is growing increasingly popular. Villiers, Rumbaken, and B.T.H. are three well-known makes available for the market. This type of ignition has certain advantages, since it saves an auxiliary drive, saves weight, and can be adapted so as to form a simple lighting set in addition to its primary function.

The M-L Maglita and B.T.H. Sparklight are well-proven examples of combined lighting and ignition

There is not a large increase in the number of spring frames, but the McKechnie-Coventry Victor suspension makes up in originality for the lack of numbers.

Some Modern Tendencies in Frame Design.

Simple framework is an all-important point on such a design as the Grigg.

Chain tensioning arrangements on the 2½ h.p. New Imperial sports model.

There is an entirely separate oil compartment in the tank of the Victoria-Villiers. An ordinary cycle pump is attached to the nozzle shown to supply a pressure feed.

Complete engine and gear assembly is secured by three point attachments in the New Imperial lightweight loop frame design.

Method of attaching the rear stand on the Wolf-Villiers

Instead of a saddle tube, a special pressed steel bracket supports the engine cradle, underscreen and gear box on the Hagg tandem.

On the XL frame the rear chain stays are continued forward to form a cradle for the power unit.

Distinctive points on the Powell frame are a cradle for the engine and an auxiliary stay to the rear of the gear box bracket.

Swinging gear box bracket for the adjustment of the primary chain on the Olympic.

Anchorage and operating gear of the external contracting band brake on the XL.

Simple gear box adjustment device on the Sunbeam.

What the Show Reveals.—

devices of the simple but efficient types. Among newcomers to motor cycle lighting sets is the well-known firm of C. A. Vandervell, and from the growth in the number of electric lighting outfits, it would appear likely that electricity will become the standard means of illumination in the future, but at the moment acetylene is the cheapest form of lighting set applicable to all types.

SIDECAR CHASSIS.

Sidecar chassis show decided improvement, and are becoming more mechanical, and strength and simplicity are taking the place of a multiplicity of fantastically curved tubes. The Girdex pressed steel chassis is one of the simplest and soundest productions.

TYRES.

Except for the all-important question of price, there is no doubt whatever that larger tyres would be fitted on almost every machine. Manufacturers have at last realised that larger tyres provide greatly increased comfort for the rider and comparative immunity from

Flywheel magnetos are increasing in popularity. This one fitted on the Hawker shows the simplicity characteristic of the type.

trouble. In these days, however, the increase in price inherent on the fitting of big tyres is apt to hinder the good intentions of the manufacturers, but many firms, however, have decided to fit larger tyres as standard, while others offer an option of oversize tyres. In this connection, it is interesting that nearly all the larger sizes of tyre are made for light cars, and, consequently, are unnecessarily expensive and heavy for motor cycle loading. A large section but comparatively lightly constructed tyre would be a boon to solo riders.

The Highest Road in Great Britain.

Is it in Aberdeenshire? Describing a Climb to an Altitude of 2,350 Feet.

WHICH is the highest metalled road in Great Britain? According to an Aberdeen reader it runs from a point on the main Deeside road some 400 yards east of Invercauld Inn to the road from Balmoral on to Loch Builg, the junction with the latter road being near the fort at the east end of Loch Builg.

This record road rises to 2,350 feet above sea level, and our correspondent would be interested to hear if any reader knows of a higher metalled road in our islands. Messrs. George Cumming, of Aberdeen, and Douglas Sangster explored this track during the summer. It is about eight miles in length, and was made by Mr. Farquharson, of In-

vercauld to replace a road across his estate which he wished to close in order that his deer forest might remain undisturbed. Mr. Cumming attempted the first pathfinding expedition with a Harley sidecar, and on several occasions he had to lift the chassis over boulders, heather, etc. Later on our two readers

made a fresh attempt, mounted on a sports Sunbeam and a 3½ h.p. twin-cylinder James respectively. They took nearly two hours to climb the 3½ miles to the summit. There are a few Inverfarigaig pattern hairpins, but the vile surface constitutes the chief obstacle, though the scenery amply compensates for the difficulties of the road.

It is alleged that a car of unknown make and ownership is the only motor vehicle which had previously attempted the climb. If any Scottish club is planning a "find a winner" competition for next summer, this road should be of interest; but it is considered far too arduous for a Scottish Six Days.

The explorers took a copy of *The*

It is claimed by the two motor cyclists who rode the above machines up that this is the summit of the highest road in Great Britain.

Motor Cycle with them, and read it ceremonially on the summit. They also deposited copies in the lounge of the highest hotel in Great Britain (the Tomintoul Hotel) and in a farm on the highest agricultural land in Great Britain (Mr. Downie's farm at Tomintoul).

Some Carburetters at the Show.

A Preponderance of Single Lever Instruments on the Market Next Year.

CAPAC.

SENSPRAY.

DEGORY.

CLAUDEL.

PETROL engines demand a perfect or nearly perfect explosive combination of air and petrol vapour to function to the best advantage.

Perfection, however, in anything is difficult of human attainment, and for that reason, no doubt, the problem of the ideal carburettor has attracted and worried almost everyone interested in motor cycle design. Almost every carburettor designer has claimed perfection for his production, but the fact that no one type or make has superseded all others indicates that, in this field as in most others, the ideal is not to be attained by one path and one method.

Tendencies, however, go to indicate that the older methods of carburetting air by means of a plain "jet in pipe," and separately controlled air and gas throttles are moribund; advantage is being taken of all the known and many guessed-at laws of pneumatics and hydraulics, and we have for 1922 a greater range of automatic (single control) carburetters than ever before.

Rock-bottom Prices.

Price appears to be a more important factor with the potential buyer at this Show than ever before. But he has little to complain of in this respect.

Popular Show Week Entertainment.

Have you seen *The Motor Cycle* film? This is a common question at Olympia this week, and by Saturday night we think there will be few answers in the negative. The film, as already announced, is showing all this week at the Polytechnic Cinema, at the upper end of Regent Street, about one minute's walk from Oxford Circus. It is included in the ordinary programme of the house, and appears at 3.30 p.m. and 8.30 p.m.

Provincial Release of "The Motor Cycle" Film.

Next week *The Motor Cycle* film starts on its round of the clubs, and will be seen at Coventry (Monday and Tuesday), Cheltenham (Wednesday), Gloucester (Thursday), and Stafford (Saturday).

Not at the Show.

A reader recently asked our Queries department whether, in the event of a four-stroke being purchased, there was any apparatus on the market for instantly converting it into a two-stroke when extra power was required, as when fitting a sidecar for occasional runs.

To New Readers.

This number of *The Motor Cycle* is enlarged, and is devoted chiefly to the all-important Olympia Show. With next week's issue we shall resume the characteristic features which have been so popular and which have helped to make *The Motor Cycle* the only motoring journal with a circulation exceeding 100,000.

Written and illustrated by keen motor cyclists of experience, our pages are practical and entertaining. They form a weekly record of the development of the motor cycle and all that assists to this end. In addition, *The Motor Cycle* contains special features of interest to the novice and the lady motor cyclist, and authoritative articles on technical subjects written so that they may be understood by all.

Current "Chat"

£20 per Day Penalty.

The registration fee for a motor cycle in New Zealand has been fixed at 5s., and the annual licence £1. The penalty for using an unlicensed vehicle is £20 per day.

High Speeds in Belgium.

Our Belgian correspondent sends us the official results of the recent Dregghem flying kilometre trials, which are as follows: Amateur Solo Championship.—M. Cauchy (Norton). Trade Class (1,000 c.c. sidecars).—1, Piérara (American X); average speed, 65 m.p.h. 1,000 c.c. Solo.—1, De Mulder (7-9 Indian), 89 m.p.h. mean speed (Belgian record); 2, Taymans (American X), 142.458 km.p.h. mean speed. Taymans on one run attained the highest speed ever attained in Belgium (91 m.p.h.). 1,000 c.c. Sidecars (Amateur).—M. Brachin (7-9 Harley), 44 m.p.h.

Special Features.

STAND-TO-STAND SHOW REPORT. WHAT OLYMPIA WILL REVEAL.

A New Fashion?

Sidecars painted in well-known public school colours are offered at Olympia attached to Brough Superiors.

Where is the Highest Metalled Road?

On another page will be found a description of a motor cycle ascent of what is claimed to be the highest metalled road in Great Britain. It is in Aberdeenshire, and reaches an altitude of 2,350ft. Does any reader know of a higher?

Defining "Sports Model."

There appears to be considerable latitude in the exact definition of a "sports model." Any solo machine on which the handle-bar grips are not more than 9in. higher than the top tube, according to a cynic, may be catalogued as a super-sporting model.

A STRENUOUS TEST FOR AN ULTRA-LIGHTWEIGHT.

Although only weighing 75 lb., this little machine—the McKenzie—successfully accomplished an A.C.U. observed test from London to Exeter and back. The illustration shows the rider, W. E. Smith, at the finish of his ride.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

"MERCURIAL FRENCH CHALK."

Sir,—In reply to the query of "BL9232" (Woking), in your issue for November 17th, as to how to carry French chalk, I am not aware how "Ixion" overcomes the dusting nuisance, but I carry a piece of solid French chalk, such as tailors use, and when required scrape a little off with a pen-knife or piece of rough glass paper. It is the acme of French chalk economy and cleanliness. FX 3462.
Cornwall.

TAXATION AND THE SAILOR

Sir,—Whilst not in the least begrudging the Revenue tax, which it is necessary for us to pay to possess the means of indulging in our sport, I certainly am of the opinion that some rebate should be made in this matter of taxation when the possessor of a machine is serving in His Majesty's Forces, more especially the Naval branches, as we have to pay the full taxation, and enjoy perhaps fourteen days or a month per year, using our machines on the highways for a total of approximately half this period, whilst our more fortunate brethren can exact their full toll from the roads, not to mention the enjoyments and benefits derived from it.

I have never seen this mentioned before in your columns, and I would like to know how it appeals to you, and your views on the subject. W.A.P.

London.

DOES THE SPARE WHEEL JUSTIFY ITSELF?

Sir,—The statement is frequently made that the modern sidecar is over-developed and needlessly elaborated. This must manifestly be rather a question of opinion than of demonstrable fact, but it may well lead to some enquiry as to how far some recent developments actually justify themselves in everyday service.

It has now become quite usual to see the powerful outfit equipped with a spare wheel, thus following car practice. No rider is obliged to carry one, of course, and many unprovided with this refinement may feel that they have reason to envy their more fortunate friends of the road.

What I would like to discover, however, is just how often that spare wheel is used; just how much of inconvenience it has really saved its owner; whether, in fact, it actually justifies itself. SIDECAR WHEEL.

Newbury.

IMPROVING AN A.B.C.

Sir,—May I trespass on your space to ask "A.B.C. Rider" (Pinner) (1.) The name of the carburetter that makes an A.B.C. tick over like a Leyland? (2.) Will he let me know his "proper gudgeon pin fixings," or where I can get the job done, or the materials to do it myself?

These questions are put in the best spirit, and not in any sarcastic sense. The slow-running device on the Claudel precludes it from taming an engine like the A.B.C., and the gudgeon pins—well, I have just tracked down a loss of power to a neat little gully in my No. 1 cylinder wall! and I find the gudgeon pin has lateral movement in the piston. Only the brass plates on the gudgeon end seem to hold it on.

I endorse all "A.B.C. Rider" says about his machine, as its comfort and charm are such that I do not want any other (bar the French "3½"). F. MASON.

[Several other correspondents also ask these questions.—Ed.]

RELATIVITY—AND THE PROP STAND!

Sir,—An article entitled "Prop Stands," which appeared in November 3rd issue of your popular journal, is my reason and excuse for wandering into your correspondence columns.

I think I have rightly gauged the psychology of the average motor cyclist when I suggest that at least 80% of the soloists who fit prop stands will use them to support their pet "speed iron" when in the garage resting from its labours.

Now, I gather that when the prop is in action the machine leans towards it, at a slight angle θ , from the vertical.

I was in the habit of using a stout bar (a length of T iron to be exact) to prop up the machine in the garage. This when in action fitted comfortably in the junction of the tubes below the saddle, while the lower end rested on a rough concrete floor; the 'bus was put in low gear, and the coefficient of friction at either end of the bar was great, and there was no chance of anything slipping or moving, and the 'bus leant at the same small angle θ , about 10° or 15° from the vertical.

Here comes the snag which might equally apply to prop stand. I said, "Good night, old darling," and propped it up in the usual manner, but next morning my horrified gaze rested upon the sight of the old 'bus huddled up on the floor with the front wheel and bars at an uncomfortable angle. A hasty inspection revealed the fact that not much damage had been done beyond a battered A.A. sign and a bent control. Further examination led to the discovery of the deflated and dejected aspect of the back tyre, which had, as tyres will, attached to its person a tintack, the pneumatic equivalent of a slow puncture.

Now with the decrease in size of the tyre was a corresponding diminution in the angle θ till $\theta = \text{zero}$; then things happened.

The moral to be drawn is "Leave not thy two-wheeled wife too long to meditate on one leg, lest, peradventure, she should 'tyre and sigh.'" HUMBER 1st.

Shortlands.

TWO-STROKE RATTLE CURED.

Sir,—I own a Villiers-engined machine, which was new in February, 1921. Up to a couple of months ago it was very satisfactory, and then it started an unpleasant rattle when climbing a long hill on top gear or when driven hard on the level.

This noise would disappear after decarbonising, but would come again within about 200 miles. I may say that all bearings are perfect, the rings have no up and down play in the grooves, and the gap between the ends is correct, so I thought I would go into the matter thoroughly.

After filing the sides of the deflector head with no appreciable improvement, I found that there were several very bright spots on the sides of the piston, so I took these down with emery, and reassembled. The difference is remarkable. The engine has now a maximum speed of 44 m.p.h. (timed, and by Bonniksen), and can be driven indefinitely at 28-30 m.p.h. or more with no sign of a rattle.

In conclusion, users of two-strokes will find immense benefit if they regularly use Spots. After not being touched for 1,000 miles, my engine was remarkably free from carbon, and both top rings absolutely free in the grooves.

G. R. PETTINGER.

NOVEL GEAR DETAILS ON 1922 MOUNTS.

Gear control on the three-speed Velocette is now effected by the usual gate, which is fixed to the tank, instead of the novel rotating knob arrangement of last year.

Showing how the gear box on the New Imperial loop frame lightweight is secured to extensions of the engine plates.

A modified form of Sturmey-Archer gear control employed on the 4 1/2 h.p. Beardmore-Precision.

Four Types of Sporting Mounts.

SINGLE-CYLINDER ARIEL.

IS THE MODERN SIDECAR TOO POWERFUL?

Sir,—I enclose a photograph which may possibly be of interest, as it illustrates the capabilities of a 1920 7.9 h.p. outfit. I may say that I do not make a habit of carrying this load (about 53 stone), but, owing to a friend having had bad tyre trouble one Sunday, and there being no trains, we all managed to get fairly comfortably seated on and in my outfit, and travelled from Noss Mayo to Plymouth, a distance of about sixteen miles. This included four bad hills, one hair-pin of nearly 1 in 4, and also the well-known Puslinch Hill. We once attained a speed of 28 m.p.h. on half throttle, and we arrived home with neither passengers nor machine any the worse.

On a difficult journey, with five up. (See accompanying letter.)

An exceptional reserve of power may be useful on such an occasion, but, for ordinary touring conditions, is it necessary? It is, however, interesting, and proves what the modern heavy motor cycle will do.

Devonport.

A FRIEND IN NEED.

TWO-STROKE FAILINGS.

Sir,—Can any reader tell me of a two-stroke that does not burn its top piston rings? Having ridden three well-known makes, I find that this is the one great fault, which becomes rather expensive when one has to keep renewing them, and it also means time and trouble fitting them.

London, S.W.6.

TWO-STROKE.

ELIMINATING MECHANICAL NOISE.

Sir,—Under this heading "Multi Gear" asks for the advice of readers on reducing the noise of the valve gear of the 3½ h.p. Rudge-Multi. I am only a prospective motor cyclist, but, as my fancy is the Rudge-Multi, I naturally take an interest in that machine. I presume "Multi Gear" is referring to the inlet valve gear, which seems to be generally reckoned to be on the noisy side. My theory to account for this is that, whereas a side valve engine has only one point of external impact (between tappet and valve stem), the Rudge has three (tappet to inlet valve rod, inlet valve rod to overhead rocker, and overhead rocker to inlet valve stem). The obvious cure is to spring-load the rocker to hold both ends of the inlet valve rod in constant contact with the tappet at the bottom and the rocker at the top. This should give silence equal to that of a side valve engine, as the gap allowed for clearance is now definitely confined to one spot, instead of distributing itself between three. Moreover, the inlet valve spring now merely has to close the valve only, allowing the use of a lighter spring, and consequently reducing wear and tear on the valve seat. Hoping this will be of some assistance to "Multi Gear."

London, S.E.18.

RUDGE IT.

Sir,—I know of an instance where a covering was placed over the overhead gear for experimental purposes, and the result was that it simply lowered the tone of the sound;

ca

this was attributed to the fact that the covering was already placed upon an intermittent vacant space (the cylinder).

I should like to suggest that "Multi Gear" try a small spiral spring, the tension of which would not materially affect the pressure of his inlet valve spring, and fit the same so that it fits over the adjustable tappet and presses against the operating rod, to which it must be connected so that the spring will constantly keep the operating rod rocker arm and valve stem as one unit.

This being done, fit a small fibre disc in the cup in which the operating rod resides, that is, between the bottom of the operating rod and the top of the adjustable tappet.

STAN HEALES.

Sir,—When I first had my Rudge I experienced a "clatter" from the valve gear, but on advice had the adjustable overhead rocker fitted by the Rudge-Whitworth Co. This, I find, does away with the noise, as the rocker can be adjusted after the engine has got hot. There is, I think, no need to explain the effect of the expansion of the cylinder on the valve gear.

RUDGE-MULTI.

Radnorshire.

MISLEADING HORSE-POWER RATINGS.

Sir,—With the Show here once again, it may not be out of place to say a few words about the present rather misleading relation between the horse-power of an engine as given by the makers and its cubical capacity. Take the 4 h.p. class. Several engines of widely different capacity are rated at this power. We have the Blackburne of 499 c.c., the Triumph 550 c.c., and the Norton 633 c.c. This anomalous rating might cause a novice a good deal of confusion as to the size and power of the respective machines. He might be led to believe that the 4½ h.p. B.S.A. is a larger and more powerful machine than the Big Four Norton, though the latter has a considerable advantage in the matter of c.c.

One notices a similar state of affairs in the smaller classes. Here we have the two-stroke Precision engine rated at 3½ h.p., and numerous four-strokes, such as the little A.J.S., which is at least the equal of the Precision in speed and power, rated at 2½ h.p., though the two engines are of the same capacity.

I learn on good authority that one of our leading manufacturers intends rating his 499 c.c. 3½ h.p. single at 4 h.p. for 1922, giving as the reason that various improvements in design justify the increase. This is where I think he is wrong. Makers' horse-power has always been an arbitrary term, bearing very little on the actual b.h.p. developed, and used as a guide to the size of the engine. Let the makers all agree to adopt some standard formula (not the R.A.C. one), or else keep to the old-established ratings. Nearly everyone realises that modern engines give b.h.p.'s far in excess of those of ten years ago.

SPEEDWELL.

Tonbridge.

SIDECAR FUEL CONSUMPTION PERFORMANCES.

Sir,—I should like to state that during September, on a trip to Bath and back, with a 14 st. passenger, I did 168 miles on a tin of No. 1 Shell—79 m.p.g.—this on a 1920 8 h.p. New Imperial sidecar. Can any of your New Imperial or other readers beat this?

E. A. PRATT.

Sir,—I am very much interested in the letter from "Ignoramus," wherein he stated that he averaged 92 m.p.g. with Triumph and sidecar (two up).

There are at least half a dozen of my friends who own late models of Triumphs and sidecars, but none of us can obtain more than 55 m.p.g. with two up, although a few of us claim to be "experts" in tuning engines, and generally competent in adjusting brakes, wheel cones, etc.

Personally, I have tried nearly all the recommended economy stunts—W.S.R. jet, extra air gadgets, etc.—but cannot get more than 55 m.p.g. with two up on the Portsmouth Road. I only carry standard equipment, an 8 st. passenger, and my own weight is 10 st. The sidecar is a Gloria Special, and is absolutely in line with the machine, and all parts, gear box, wheels, engine, and valve clearances are attended to regularly. The compression is good, and no leaks are present in the induction pipe of the Triumph carburetter.

Now, can "Ignoramus" give your readers a few hints, such as type of carburetter, valve clearances, type and weight of sidecar, weight of driver and passenger, blend of spirit used, type of screen (if any), etc.?

H. S. B. BOOTH.

WHY NOT RUBBER?

Sir,—I wish the A.A. could invent a new badge. I get caught up in mine about twice a week. HUMBER 1st. Shortlands.

STANDARD ENGINES AT BROOKLANDS.

Sir,—Under "Occasional Comments" in your issue of October 27th "Ixion" mentions the fact that the two Indians entered for the scratch races at the last B.M.C.R.C. meeting had, according to Mr. W. H. Wells, absolutely standard engines. I have been present at most of the meetings at Brooklands this year, and have noticed that the Indian machines usually arrive at the track in a motor van, with mechanics *ad lib.*, and perhaps Mr. Wells will explain why it is necessary to keep his engines covered with a blanket, both before and after the race. Is he afraid of his wonderful engines being too closely inspected by an admiring public? F.E.L. Dulwich.

ACCIDENTALLY INTENSIFYING THE SPARK.

Sir,—Having read with much interest the letter in your valuable columns from Mr. W. H. Massey, and duly noted that this gentleman has apparently got static electricity well between his fingers, I should be obliged if you would kindly publish the few queries herewith, in order that Mr. Massey might see them, and let me, together with some friends who are interested, have his opinion upon the matters in question.

Although the topic is not in connection with auxiliary spark gaps, Mr. Massey will probably be somewhat interested.

A friend of mine has a baby two-stroke of well-known make, in which he used an old pre-war Bosch plug until quite recently. Having the misfortune to crack the insulator on this plug one afternoon, I lent him a plug of a well-known British make. After covering about two miles his engine petered out quite without warning, and upon our examining the plug we found that it was bridged across the gap by a large piece of carbon. We cleaned the plug and replaced, only to have the same occurrence one and a half mile further on. This continued throughout the day. Upon arriving home, my friend attached an old O. and J. plug protector, which is a small cup shaped aluminium object, being made with numerous radiating fins around its sides; it drops over the top of the central pole of the plug, and is held down by the terminal screw. This thing he had long ago thrown aside, upon my advice, as being useless.

After fitting it he rode for the whole evening without any sign of the trouble, and has continued to do so without trouble for the past three weeks.

What we want to know is, What effect did this plug protector have on this plug to prevent it from sooting up? My friend says that it is owing to the protector keeping the central electrode cool; but, in my opinion (based upon the use of condensers in the wireless service), the large aluminium surface extending right down the body of the insulator to within $\frac{1}{2}$ in. of the metal body of the plug, forms a sort of condenser with air di-electric across the points of the plug, thus intensifying the spark and preventing the carbon from forming on the points. SPARKLET.

London, N.2.

HOW "FORTY-FIVE" AVERAGES ARE MAINTAINED!

Sir,—In these days of high speeds and non-stop runs, the following little episode is somewhat amusing and instructive.

I was running North a few days back, and stopped at the Red Lion café at Stamford about 10 a.m. for some refreshments. The shop was soon after invaded by four "speed merchants," and the air was full of "non-stops," "50 (to) 70 m.p.h.," etc. They left just before I did, riding respectively a Triumph, Rudge, 2 $\frac{1}{2}$ h.p. Douglas, and Levis. I was riding a 4 h.p. Douglas sidecar, and overtook them the other side of Grantham. They were all well down to it, doing between 55 and 60 m.p.h. (?) My speedometer was at "31 m.p.h.," but I have always had my doubts about that instrument. I thought nothing more about it, and arrived at the Three Greyhounds at Boroughbridge at 7.30 p.m. At 9.15 in walked the four gentlemen, and we entered into conversation.

I will say this for them, they told the tale well. They had left Finchley about two o'clock that afternoon, and came through non-stop at an average of 45 m.p.h. No! more than

that, as one of them remembered that they had stopped for tea at Doncaster. I enjoyed the chat, and am afraid rather led them on.

The next morning I was just leaving when one of them appeared. I was in warpaint again, and he looked hard. "Weren't you at Stamford yesterday morning?" I slipped in my clutch. E.L.S.

London, E.C.4.

SNOW BOOTS FOR WINTER RIDING.

Sir,—It has always surprised me that so few motor cyclists make use of snow boots in conjunction with overalls during winter riding. I have always done this, and can thoroughly recommend the practice to other motor cyclists who may suffer from cold feet. The advantages are that you arrive at your destination with feet that are warm and cleanly clad. Also it is possible to ride in the worst weather using an ordinary pair of light house shoes. COLD PAWS.

Cambridge.

ETHICS OF THE A.A. SERVICE.

Sir,—One often sees correspondence in the motor press from people who wonder what benefits they derive from belonging to the A.A. Such people evidently expect a scout to spring up from the earth, like a benevolent genii of the Arabian Nights, every time they have a breakdown. I have just completed 4,000 miles on my sidecar, my travels taking me to all parts of the country, and I can honestly say that the silent service of the A.A. in indicating the names of towns and villages with the yellow discs, giving intermediate distances, and erecting notices of warning and advice, etc., has been of invaluable assistance and worth ten times the amount of the subscription. Moreover, the facilities afforded at garages showing the A.A. sign have done much towards making the season's riding so pleasurable.

I have never needed the assistance of a scout, for I regard such help as "sick benefit" from the A.A.; and I try to emulate the veteran member of the Ancient Order of Foresters, who boasted that he had paid in for fifty years and drawn nothing out! In other words, I keep the machine in such a healthy condition that it needs no doctoring on the road. I was led to join the A.A. by participating in its silent service, as indicated above, for nothing, and suddenly realising that it was time I paid something for it. There are thousands of motor cyclists who benefit from this A.A. service without a twinge of conscience at taking something for nothing. I have no connection with the A.A. except being a satisfied member. TRIUMPH.

Northampton.

SUMMARY OF CORRESPONDENCE.

"G.G." (Hove) complains of an extraordinary run of bad luck with brand new tyres. Five covers only gave him 1,500 miles.

Books & Maps for Motor Cyclists.

Issued in conjunction with *The Motor Cycle*.

"MOTOR CYCLES AND HOW TO MANAGE THEM."

The standard handbook on the motor cycle.

Price net, 2/6. By pos., 2/10

IMPROVEMENTS IN DETAILS.

Unit Assembly of Engine and Gear Box. Examples of the Latest Four-stroke and Two-stroke Piston Design.

Engine, footboards, magneto and engine plates may be removed as a unit from the Chater-Lea two-stroke.

With gudgeon pin and rings the aluminium slipper piston on the o.h.v. Triumph weighs but 14 oz.

Following a practice which is yearly becoming more popular, the New Imperial engine and gear box are assembled as a unit.

A PORTED TWO-STROKE PISTON.

There is a transfer port in the thrust side of the Omega 2-stroke piston, which is of the three ringed type.

Tyre repair on the $4\frac{1}{2}$ h.p. Humber is facilitated by a quickly detachable rear wheel and a hinged mudguard.

Chain adjustment does not upset the Sturmey gear control on the sports model Francis-Barnett; the quadrant moves with the gear box.

Power unit and silencer of the Hack miniature.

COMPACT DESIGN.

On the new duplex frame Omega the engine and gear box are assembled as a unit.

Gears and propeller-shaft on the new 8 h.p. F.N. shown with the gear casing removed.

East London M.C.C.

A club has recently been formed as above. The entry and subscription fee is 10s. 6d., which will carry the member up to December 31st, 1922. Application for entry should be made to Mr. J. R. Watkins, "The Old Three Colts," 450, Old Ford Road, Bow, London, E.3.

Shepley and District M.C.

In order to maintain interest in the club during the winter months a series of three social evenings are being arranged, to be held on the second Friday in each month. The first will be held in the United Methodist School, Shelley, on Friday, December 9th. There will be no charge for admission, and all motorists and their friends will be welcomed.

Tiverton M.C. and L.C.C.

The committee is arranging an attractive social programme in order to provide members with wholesome entertainment during the long and dreary winter months. Efforts are being made to acquire "headquarters," and as soon as they are obtained whist drives, dances, concerts, etc., will be held on best possible lines. There are now over 100 members. The first annual club dinner will be held on January 5th.

Worcester and District M.C.C.

Results of the one day sporting trial held at the end of October have now been announced:

ERIC WILLIAMS CUP AND FIRST-CLASS CERTIFICATE.—Best solo performance: J. A. Newman (3½ Douglas).

PRESIDENT'S CUP.—Best performance by a passenger machine under 1,100 c.c.: Tie, R. Brown (3½ Sunbeam sc.) and B. Bladder (8 New Imperial sc.). In view of this tie, the cup is to be held by the winners for six months each, and in consideration a club medal is awarded to each instead of a certificate.

RUNNERS UP.—Special gold medals: Solo, F. Moir (8 Zenith); passenger, F. Moirall (4¼ B.S.A. sc.).

FIRST-CLASS AWARDS.—Club medals: J. Cave (8 G.N.), W. A. Carr (8 Morgan), J. M. Doshier (8 Enfield), A. G. Silk (8 G.N.), J. L. Shaw (8 Morgan), C. Rogers (3½ Sunbeam), and S. W. Lewis (6-7 B.S.A.).

TEAM PRIZE.—Worcester team.

Winter Social Events.

Tuesday, Dec. 6th.—Leaves and District M.C.C. Annual Dinner.
Wednesday, Dec. 7th.—Clitheroe and District M.C.C. Lecture on "Carburation."
Wednesday, Dec. 7th.—Kidderminster M.C.C. Annual Dinner.
Friday, Dec. 9th.—Shipley and District M.C.C. Social Evening.
Thursday, Dec. 15th.—Redditch and District M.C.C. Annual Dinner.
Friday, Dec. 16th.—Bradford M.C. and L.C.C. Annual Dinner.

West Birmingham M.C.C.

At a recent general meeting it was decided that the club should continue solely as an amateur club. A new committee and officials were elected, including a lady secretary, Mrs. H. G. Gale, 49, Rookery Road, Bournbrook.

North London M.C.C.

The closing event of the year consisted of a short paperchase, which was won by L. P. Walters (4 Triumph). Tea was taken at Radlett, and a very pleasant social evening was spent there.

The club has formed a football team to play during the coming winter, and would like to arrange matches with any other motor cycle club which has a similar team. The football secretary is Mr. R. H. Baxter, 6, Methuen Park, Muswell Hill, N.10.

TO CLUB SECRETARIES.

"The Motor Cycle" Film will shortly be available for loan to enterprising clubs who are keen to make their winter social events a success. This exclusive film takes about forty minutes to exhibit and the programme includes scenes at the Junior and Senior T.T. Races, the 500 Miles Race, the Six Days Trials and the Grand Prix Car Race. Club secretaries should write to the Editor (Film Department), "The Motor Cycle," Coventry, suggesting two or three alternative dates, preferably in April or after.

Sutton Coldfield and North Birmingham A.C.

A. W. Thrush (3½ Sunbeam) was the winner of the Sutton Cup in the recent trial for that trophy. R. G. Beesley (3½ Sunbeam sc.) made the best sidecar performance.

The club's annual dinner will take place on Friday, January 20th, 1922.

Birmingham M.C.C.

Provisional fixtures for next year have now been announced. The most important event, the Victory Cup trial, will be held on either March 25th or April 1st. A final trial for this year will be held on December 27th.

Cumberland County M.C.C.

A lecture was held recently in the Crown and Mitre Hotel, Mr. W. Theodore Carr, M.P., presiding. The lecturer, Mr. E. H. Spence, Chief Constable for the city, chose as his subject "Road Traffic," and treated his audience to a thoroughly able and well-delivered discourse.

Eccles District M.C.C. (Proposed).

A suggestion has been made to form a club as above, and judging from the enquiries already made, the membership promises to be extensive. Those interested should communicate with E. Mees, 40, Church Street, Eccles.

Dublin and District M.C.C.

At the annual general meeting of the Dublin and District Motor Cycle Club, held on the 15th ult., the reports of the hon. treasurer and hon. secretary for the past year were adopted. The committee was able to report that, despite the troubled state of affairs in Ireland during the past year, nine competitions were held during the season. The treasurer's report showed a substantial balance in hand after discharge of all liabilities. It was decided to make an effort to induce the Cycle and Motor Cycle Manufacturers and Traders Union to recognise officially the annual twenty-four hours reliability trial of the club.

ABBREVIATIONS EXPLAINED.

NEWCOMERS to motor cycle matters must often be puzzled by various technical abbreviations which continually crop up wherever any phase of the pastime is discussed.

The following table explains a few of the most common:

h.p. = horse-power.
b.h.p. = brake-horse-power.
c.c. = cubic centimetres (often erroneously used to denote the words "cubic capacity").
mm. = millimetre.

o.h.v. = overhead valve.
o.h.i.v. = overhead inlet valve.
o.h.e.v. = overhead exhaust valve.
a.i.v. = automatic inlet valve.
V twin = a two-cylinder engine with the cylinders set radially, but not at 180°.
flat twin = a two-cylinder engine with the cylinders set at 180° (sometimes called "h.o." or horizontally opposed).
two-stroke = an engine (usually valveless) on which the cycle of operations is completed in one up and down movement of the piston, i.e., two strokes.

four-stroke = an engine in which the cycle of operations is completed in two up and down movements of the piston, i.e., four strokes.
t.d.c. = top dead centre (used to signify the position of the piston when it is at the upper extremity of its stroke).
r.p.m. = revolutions per minute.
m.p.h. = miles per hour.
km.p.h. = kilometres per hour.
k.s. = kick-starter.
h.b.c. = handle-bar controlled.
m.e.p. = mean effective pressure (signifying the average pressure in the cylinder throughout the whole cycle of operations).

Of increased capacity (555 c.c.), the $4\frac{1}{2}$ h.p. P. and M. engine is a very clean design. The timing cover has been removed to show the simplicity of the valve gear.

There are no radiating fins on the inlet valve pocket of the $4\frac{1}{2}$ h.p. Abingdon engine.

Detachable valve pockets have long been a feature of the flat twin Humber.

Interesting Engines fitted to 1922 Motor Cycles.

Details of Three New "Big Singles," a Four Valve Speed Engine, a Rotary Valve Two-stroke, and Two Flat Twins.

Connecting rod and roller bearings used in the $3\frac{1}{2}$ h.p. sports model Douglas

Few engines at the Show are attracting as much interest as the four-valve Triumph. This view shows the rocker gear, twin exhaust pipes, and the neat detachable silencer.

An inclined cylinder has long been a feature of the $2\frac{1}{2}$ h.p. S.A.V. two-stroke engine.

Although the $4\frac{1}{2}$ h.p. Beardmore-Precision engine is in a unit with the gear box, the primary drive follows "non-unit" practice, being by chain.

In one form the $2\frac{1}{2}$ h.p. James lightweight is fitted with a 2 1/2-speed gear box, with clutch and kick-starter.

Facts and Figures Respecting the Industry.

130,000 British Motor Cycles Produced Annually. Future Prospects Discussed at the Annual Manufacturers' Banquet.

ON the eve of the Show, the seventh annual banquet of the British Cycle and Motor Cycle Manufacturers' and Traders Union was held at the Hotel Cecil, Sir Harold Bowden, Bart., presiding over a large and distinguished attendance. Lord Morris, in proposing the toast of the manufacturers, drew attention to the value of the cycle and motor cycle industry to the country, instancing the fact that in a normal year, 600,000 pedal cycles and nearly 130,000 motor cycles are manufactured. Wages paid are approximately sixteen millions, and the capital invested somewhere in the neighbourhood of thirty millions. He pointed out that competition abroad was keen, and must be realised by home manufacturers, who do not experience the same foreign competition at home. The love of motor cycling, he pointed out, constantly increases, and he expressed the opinion that within ten years a million motor cycles would be on the road. Replying, the Chairman mentioned that the 357 members of the Union gave employment to something like 110,000 men and women. One of the features of the industry was its valuable export trade, now unhappily affected by the general trade slump. He quoted figures to show that exports had fallen away sadly since 1920, £6,000,000 representing the loss in export trade to the end of September compared with the corresponding period of 1920. This he ascribed to (1) the policy and action of trade unions toward industry since the war, (2) the collapse of the German mark, and (3) the intolerable burden of taxation. He calculated that the loss represented in wages would be sufficient to keep an army of 30,000 men employed for a year at £4 per man weekly.

Modern Prices.

To solve the problem confronting manufacturers, the Chairman stated that manufacturing costs were being reduced by arrangement with workpeople, and profits cut to the bone by anticipating possible reductions. Such a course was necessary, he said, to secure next year's business, the object being to inspire confidence in the buying public, and enable them to place their orders without fear of further reductions in price. Manufacturers, too, looked to the

Government to assist by stabilising Exchanges and co-operating with the banks.

The Chairman added that certain tariff adjustments have been secured from Spain and Belgium as a result of the joint effort of the Union, the F.B.I., and the British Ambassadors in the countries concerned. Turning to the question of roads, he pointed out that road users felt that the attitude of the Ministry of Transport and of the police is still tinged with the acerbity and lack of understanding which has too long been usual in connection with official control of mechanical vehicles. Local byelaws, too, he considered of an incessantly interfering character. The

revenue extorted from the industry is considerable, and it is the only industry called upon to pay a direct tax (for general identification plates) in addition to the rates and taxes imposed upon any commercial venture.

Administration of the Road Fund.

Reconstruction and improvement of roads, Sir Harold Bowden urged, is not proceeding as fast or as efficiently as ought to be the case. He was not satisfied that the Road Fund is being wisely spent, or that the cost of reconstruction had been brought down to the lowest possible figure. Today, 16s. per square yard was paid—the pre-war figure being 3s. 6d. per square yard.

If more efficient methods could not be adopted, he contended that the balance in the hands of the Government created by motor taxation should at once be returned to the user in the shape of substantial reductions of tax, since at the end of this year motorists will have paid £11,000,000 in taxes instead of £8,000,000 estimated as required.

In conclusion, he drew attention to this week's Exhibition as the greatest cycle and motor cycle show the world has ever seen, and the exhibits represented the best value offered in this country.

Mr. W. G. Bower (vice-president) proposed the Guests, responded to by Mr. Arthur Neal, M.P., Parliamentary Secretary Ministry of Transport (who referred to the new quarterly licences for motor cycles in 1922), and Sir Ernest Wild, K.C., M.P., Chairman of the British Empire Union.

Monday at the Olympia Show.

THE OLYMPIA MOTOR CYCLE SHOW ON THE OPENING DAY.

Impressions of the exhibits at this week's annual Show at Olympia. Although thick fog prevailed there were a great many visitors immediately the turnstiles started to click at 10 a.m.

OLYMPIA opened at 10 a.m. on Monday in a thick fog of almost unprecedented density. As a result, the attendance during the first hour was rather meagre, but the hall gradually filled as the day wore on. The interior of the building was almost as foggy as it was outside in the street, and it was difficult to see across the hall. At mid-day Olympia was fairly full, and at lunch time the fog had cleared off, and bright sunshine graced the opening day.

DELAYED IN TRANSIT.

SEVERAL exhibits were not complete at the time of our visit on Monday, and at least two had not arrived. These were the Cedos, which we learned were on the way, and promised to be something startling in the way of value; the other was the Peugeot motor cycle exhibit, which, it was expected, would not arrive before this issue of *The Motor Cycle* was on sale in Olympia.

Quite a number of stand holders had a very anxious time on Sunday. Several trucks containing exhibits from the North were "mislaid," and, evidently anticipating this trouble, one exhibitor sent his machines by road under their own power.

Several firms reported good business even on the opening day. In the Accessory Section, stall-holders assumed a cheerful attitude, and people are certainly of opinion that the corner has been turned.

Several of the better-known stands attracted great crowds, and it was difficult to get near the more popular makes of machines. The Show is open from 10 a.m. to 10 p.m. each day, and the price of admission is 2s.

Sir Harold Bowden, Bart., President of the British Cycle and Motor Cycle Manufacturers' and Traders' Union, organisers of this week's Motor Cycle Exhibition at Olympia. He presided at the banquet on Friday evening last. See page 703.

26,729 motor cycles were registered in Germany on July 1st, 1921. Cars on the same date numbered 60,966.

The possibility of a petrol price war is discussed in *The Autocar*.

A Royal Visit.

Yesterday (Wednesday) at 10.30 a.m. H.R.H. the Duke of York was due to visit the Motor Cycle Show at Olympia. It was arranged that the visit would be less formal than is usually the case, since the Duke of York, as a keen motor cyclist and car owner, desired to rove about the hall at his free will and examine various makes of machines. H.R.H. is a keen supporter of motor cycle racing.

LONDON TO EXETER ON A 75 lb. LIGHTWEIGHT.

A SUCCESSFUL trial has just been completed under A.C.U. observation by an ultra-lightweight called the McKenzie. The rider, W. F. Smith, rode from London to Exeter in a day, and finished the journey on Thursday afternoon at about 1.50 at the Marble Arch, having voluntarily taken two days over the return journey. He reported a 'no-trouble ride, and only assisted the machine with the pedals on very few occasions. The main road to Exeter was taken, including Chard Hill.

A Lady's Attempt.

The engine is 60x60 mm. (160 c.c.) two-stroke, driving direct by belt to the rear wheel. It closely resembles a lady's motor cycle so far as the frame is concerned, and is fitted with pedals and a chain guard. A lady, Mrs. MacFarquhar, of Earl's Court, also attempted the journey on a similar machine, but, not having ridden a motor cycle before, skidded three times on the tramlines shortly after the start and perforce had to retire.

The A.C.U. report will be published in due course.

Approximately 400 photos

A STAND-TO-STAND DESCRIPTION OF MOTOR CYCLES, SIDECARS, AND THREE-WHEELERS ON VIEW AT OLYMPIA (Nov. 28th to Dec. 3rd).

The reports and illustrations have been prepared by the staff of "The Motor Cycle" after personal examination of the exhibits.

A.J.S. (127.)

2½ h.p. MODEL.—74×81 mm. (349 c.c.); single-cyl. four-stroke; side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick starter; chain drive; 26×2½ in. tyres. Prices: Solo £85, with sidecar £110.

A. J. STEVENS AND Co. (1914), LTD., Wolverhampton.—For 1922 the famous

Engine-shaft shock absorber fitted to the 7 h.p. and 2½ h.p. A.J.S.

2½ h.p. A.J.S. will be marketed in three models—touring, semi-sporting, and sporting, the last model capable of approximately 60 m.p.h., and being one of the principal attractions of the Show. The phenomenal double victory of the A.J.S. in this year's T.T. has induced many

veteran riders to regard the 350 c.c. engine as ample for all touring purposes; and those who have come to this decision are naturally interested in the

Footrest adjustment on the 2½ h.p. A.J.S.

Modern Tendencies.

PROGRESS in design is discernible in every type of motor cycle for 1922. The article "What the Show Reveals" (page 687) reviews these improvements in detail. Further to assist readers who are visiting Olympia to assimilate the main items of interest, the outstanding features are summarised below:

- (1) Increased number of big single motor cycles.
- (2) Lightweight sidecars.
- (3) The vogue of the sporting model.
- (4) Unique frame design.
- (5) Motor cycles with open and duplex frames.
- (6) New 8 h.p. outfits.
- (7) New lightweight three-speed gears.
- (8) Sleeve and rotary valve engines.
- (9) Oil-cooled engines.
- (10) The value offered in runabouts.
- (11) New miniature motor cycles.
- (12) Popularity of saddle tanks.

machine which is principally responsible for the change. The stripped sporting model is specially lightened, has a flat bar, narrow mudguards, no kick-starter, and footrests instead of footboards. All three models have much larger tanks than formerly, and the gear lever is now sloped forward to clear the knees of a long-legged rider. The long exhaust pipe is supplied with an aluminium expansion box and detachable fish-tail. All reciprocating parts of the sporting engine are specially lightened, and some details of the A.J.S. secrets of tune are embodied in it. The semi-sporting model

Fitted to the 2½ h.p. A.J.S. machines, this new type of Druid fork provides for direct and tangential shocks.

The Olympia Show—

is a little lighter than the standard, and has a special engine. All three models contain the familiar A.J.S. specialties—detachable head, detachable wheels, internal expanding brakes, etc. A special lightweight sidecar (£107 complete) is

Detail alterations in mudguarding, lighting equipment (now a Magdyno), and exhaust pipe fittings, have not greatly altered the appearance of the 7 h.p. A.J.S. sidecar.

marketed, and can be stored in a space 6×5ft.

7 H.P. MODEL.—74×93 mm. (799 c.c.); twin-cyl. four-stroke; side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 700×80 mm. tyres. Price, with sidecar £175.

As their competition records would suggest, these machines have undergone practically no change for next year. Ferodo has now superseded cork inserts in the clutch. There is a new cush drive on the engine-shaft. The exhaust pipes are now attached to the cylinder head by external nuts, and mudguarding has been improved. Coachwork remains much the same. A notable addition is an unbreakable side screen for clipping on to the off side of the sidecar, and prevents draught being deflected into the seat by the driver's body. A large double-seated sidecar attracts the attention of the family man; but, since the A.J.S. is one of the best known sidecar outfits on the market, further details are unnecessary. A Lucas Magdyno may be obtained as an extra.

Fitted with an 8 h.p. M.A.G. engine, this Ariel replaces last year's chain-driven 6-7 h.p. model.

ARIEL. (89.)

3½ H.P. MODEL.—86.4×85 mm. (498 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch; chain-cum-belt drive; 26×2½ in. tyres. Price, solo £87 10s.

ARIEL MOTORS, Ariel Works, Bournbrook, Birmingham.—Undoubtedly one of the most attractive of solo mounts is the 3½ h.p. sports Ariel. No kick-starter is

A toe-operated brake is fitted to the sports model Ariel. Note the oil lead to the chain case.

4½ H.P. MODEL.—92×100 mm. (665 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×5 in. tyres. Prices: Solo £105, with sidecar £140.

A dual-purpose mount which has already made its mark is the 665 c.c. big single-cylinder Ariel. The engine follows Ariel practice, inasmuch as the valves are spaced widely apart, and a decompressor is fitted to ensure easy starting. All-chain transmission is adopted through a three-speed gear box. The frame is specially designed with a long steering head and low saddle position, but at the same time the ground clearance is 5½ in. Internal expanding brakes are fitted to both front and rear wheels, which are of 28 in. diameter. The comfort of the driver is ensured by the spring saddle pillar. With its all black finish and Royal blue tank, this machine is particularly handsome.

Change-speed quadrant on the Ariel sports model. It is conveniently well forward.

6-7 H.P. MODEL.—73×95 mm. (796 c.c.); twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; Cox carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2½ in. tyres. Prices: Solo £110, with sidecar £140.

For the rider who prefers a twin-cylinder engined outfit, the 6-7 h.p. model is provided. It is similar in its general specification to the 3½ h.p. single-cylinder model.

8 H.P. MODEL.—82×94 mm. (994 c.c.); twin-cyl. four-stroke; overhead inlet valves; drip feed lubrication; Cox carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×5 in. tyres. Prices: Solo £125, with sidecar £160.

An interesting new model is the 8 h.p. outfit with the well-known M.A.G. engine, having overhead inlet valves arranged directly above the exhaust. Except for the engine, the machine is on

"Internals" of the Ariel front brake. An oil trap prevents lubricant working up to the shoes.

The Olympia Show—

similar lines to the 4½ h.p. single-cylinder model, and has the internal expanding brakes and all-chain drive which are found on that model. If desired, the clutch may be arranged for both hand and foot operation at slight extra charge, while the *de luxe* model, which includes Lucas Magdyno lighting, electric horn, and metal leg shields, is priced at £181.

ABINGDON. (42.)

4½ h.p. MODEL.—85×110 mm. (624 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; Senspray carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×3in. tyres.

ABINGDON WORKS, LTD., Tyseley, Birmingham.—One of the many big singles shown at Olympia, and among the most attractive exhibits there, the 4½ h.p. Abingdon was primarily designed for heavy passenger work; consequently, the engine is simple in design and sturdy in construction. The valves are actuated by a single cam, the inlet valve having direct lift through a tappet housed in a long cast iron guide, while the exhaust is worked through a bell crank rocker. There are only two gear wheels in the timing gear, and these are of exceptional width, so as to ensure quiet running. The lubrication of engines is a matter to which the designer has for many years given careful attention. The oil is led through a large plain bearing on the timing side, and forced inwards by the action of the timing-shaft, on the bearing of which a special spiral groove is cut. The escaping oil is caught in a thrower ring, and flung by centrifugal force to the big end, which has a bronze bush of exceptional area. The driving side of the crankshaft runs in a large diameter Skefko bearing, the outer race of which is housed in a steel ring, and not in the aluminium of the crank case. Particular

Only the exhaust pocket carries radiating fins on the 4½ h.p. Abingdon King Dick engine.

care has been taken to render the bearing oil-retaining. A cast iron piston is employed with three top rings and a lower ring acting as a scraper, the oil return holes being provided leading directly into the gudgeon pin bosses. The connecting rod is of I section, and is split at the small end, and when

28×3in. tyres, sturdy frame construction, and a large "slogging" engine, eminently suit the 4½ h.p. Abingdon for sidecar work.

tightened up grips the centre of a large diameter hollow gudgeon pin. Cooling has been carefully studied, the fins being of large size, and there are wide air spaces between the ports and the cylinder.

3½ h.p. MODEL.—85×68 mm. (499 c.c.); single-cyl. four-stroke; side-by-side valves; hand pump lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2¼in. tyres.

A thoroughly useful double-purpose mount equipped with well valenced mudguards, footboards of ample size, Webb front brake, and the new M-L magneto. The forks are the Maplestone, specially made for this model. The 3½ h.p. T.T. sports model closely resembles the former, except that it has belt drive, footrests instead of footboards, and a silencer with a large expansion chamber and an exit pipe reaching to the level of the rear spindle. It has the same tyres, but a Senspray carburetter.

6-7 h.p. MODEL.—73×95 mm. (795 c.c.); V twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; Cox-Atmos carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; all-chain drive; 28×3in. tyres.

The 6-7 h.p. Abingdon King Dick is a fine sidecar machine, its engine following the excellent lines, so far as the lubrication is concerned, which have for a long time been Mr. Blumfield's speciality. In common with other models, needle valves control the petrol supply and priming device. The petrol priming tap is released in the same manner as the petrol tap to the carburetter, but no petrol flows therefrom unless the plunger is depressed after the opening screw has been screwed down. Detachable and interchangeable wheels are fitted to this model. An excellent car pattern internal expanding brake is fitted to the front wheel, and Druid forks are used. The ground clearance is ample for Colonial service.

The Olympia Show—

In general aspect the $4\frac{1}{2}$ h.p. B.S.A. sports model closely resembles its touring prototype, but footrests and "flat" handle-bars make it essentially a solo machine.

B.S.A. (43.)

8 h.p. MODEL.—80×90 mm. (985 c.c.); twin-cyl. four-stroke; side-by-side valves; mechanical lubrication; B.S.A. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×3in. tyres. Price with sidecar, £185.

B.S.A. CYCLES, LTD., Small Heath, Birmingham.—A machine highly suitable for sidecar touring, with interchangeable wheels, cast aluminium chain cases, and extraordinarily generous

gun; consequently the fork spindle can always be adequately lubricated. The sidecar is carried out on luxurious lines, and has ample luggage accommodation.

6 h.p. MODEL.—75×85 mm. (770 c.c.); V twin-cyl. four-stroke; side-by-side valves; mechanical lubrication; B.S.A. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain-driven 26×3in. tyres.—Prices: Solo £132, with sidecar £164.

The model just described is a large edition of the popular 6 h.p.; which is

This short wheelbase model flat twin Coventry Victor is intended as a dual-purpose mount.

mudguarding. The equipment is particularly good; the rear brake is of the internal expanding pattern, whilst the front brake works on a dummy belt rim, and there is also an additional dummy belt rim brake on the rear wheel; consequently, so far as stopping the machine is concerned, this model is in excess of the re-

quirements of the law. Particular attention has been paid to the lubrication of the forks, which are supplied with threaded nipples designed to take a grease

now fitted with a lighter frame. This model is known as the Light Six. It is provided with the same type of sidecar body as the 8 h.p., but the chassis is rather simpler in construction, and the wheels, though they can be easily detached, are not interchangeable, as in the

Springing on novel lines is incorporated in the 5-6 h.p. McKechnie-Coventry Victor. The engine and gear unit pivots at the rear axle.

case of the larger machine, while both brakes are of the dummy belt rim type. On this model the third brake is not fitted.

$4\frac{1}{2}$ h.p. MODEL.—85×98 mm. (557 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; B.S.A. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2½×2½in. tyres. Prices: Solo £107, all-chain £110; with sidecar £139, all-chain £141.

An excellent double-purpose machine, fitted with chain-cum-belt drive, is the $4\frac{1}{2}$ h.p. B.S.A. The finish throughout is good, and the mudguarding is luxuriously carried out, the front being well-balanced, and the rear of great width (9in.) The belt rim screws on to the hub flange, and is secured by a locking ring, whilst there is a dummy belt rim on the opposite side of the wheel for the rear brake, the front brake being of a similar type. To facilitate starting, a decompressor is fitted. There is also a sports model of this type, which is fitted with lighter piston and connecting rod. The exhaust pipe is of large dimensions, and

A bold attempt to solve the problem of weather protection for London-Exeter competitors: the new B.S.A. shields, complete with-celluloid screen.

the expansion chamber has a dual exit pipe, while slightly lighter flywheels with polished rims are used. The lubrication is by Best mechanical oil pump, and a special racing carburettor forms part of its equipment. Footrests are supplied instead of footboards, and the handle-bars are of the T.T. pattern.

COVENTRY VICTOR. (32.)

5-7 h.p. MODEL.—75×78 mm. (688 c.c.); flat twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac 2-lever carb.; M.L. chain-driven mag.; Sturmey-Archer 3-sp. gear; clutch and kick-starter; all-chain drive; 28×3in. tyres.

COVENTRY VICTOR MOTOR CO., LTD., Coventry.—As anticipated in *The Motor Cycle* last week, this stand is of more than usual interest. Since it is, an

The Olympia Show—

Instead of the original silencer above the engine, the silencing arrangements on the chain-driven Zenith-Bradshaw have been re-designed as indicated above.

Semi-elliptic spring of the Calthorpe sidecar.

Arrangement of overhead twin inlet and exhaust valves and valve gear on the 3 1/2 h.p. Triumph.

Easily accessible, the Matchless metal tool box is located on the tank.

What NOT to miss at Olympia—

The Berthron boat sidecar in the Annexe.
£67 sidecar outfit on the Verus stand.

A new Connaught two-stroke of 370 c.c.

The long stroke Sports Sunbeam.

Hawker's new 2 1/2 h.p. sporting model.

The record-breaking four-valve Triumph.

The miniature M-L cobalt steel magneto.

The sectioned rotary valve Sun two-stroke.

A J.E.S. lady's miniature on orthodox motor cycle lines.

A primrose coupé sidecar attached to a four-cylinder F.N.

A two-speed gear hidden away in the crank case of the J.E.S.

The sectioned Barr and Stroud single sleeve valve engine.

4 1/2 h.p. P. & M. four-speed sidecar at £130.

The numerous Canoelet sidecars of every shape and hue.

Parcel tray in dashboard of Morgan and Scott Sociable, *a la* car practice.

B.S.A. aluminium windshield for the driver, with removable "look out" window.

The £145 Scott sports sidecar, sold with a guarantee of 60 m.p.h.

The workmanlike "all-steel" Beardmore-Precisions.

The new Smith top tube instrument board in the Gallery.

The three methods of clutch operation on the Reading Standard sports model.

The original Peters two-stroke, now made in the Isle of Man.

The cunning kinks in the Sheffield-Henderson tank tube.

The Indian camp—notably the Chief and his Princess.

The various improved saddle suspension systems.

The aluminium-bodied New Hudson runabout.

The side-by-side two-seater and also a convertible one-two-seater sidecar on the Royal Ruby.

710 x 85 mm. tyres on the new 6 h.p. Douglas, as well as its novel saddle suspension.

A natty sliding windscreen on the Douglas sidecar, which may be clamped in any position.

The examples of artistically rounded tanks on the Francis-Barnett, Brough Superior, and Quadrant.

The Harley-Davidson saloon sidecar at £275. A most ambitious production of its kind.

"The Motor Cycle" photographic enlargements of 1921 events—and the cinema film!

A new 350 c.c. single-cylinder Bradshaw oil-cooled engine on Walmsley & Co.'s stand.

An extraordinary O.E.C. landaulet sidecar, which alone costs 130 guineas, and complete with a wheel-steered 8 h.p. machine, 252 guineas.

Saddle tank used on the Coventry Eagle models.

Cut-away view of the Martinsyde tank showing the separate oil compartment.

Eccentric adjustment for the primary chain on the Martinsyde.

A subsidiary bar for carrying instruments on the 350 c.c. sports model Edmund. The bar can be rapidly detached.

Chain extension to kick-starter on the duplex-framed Omega.

The Olympia Show—

entirely novel design, we will deal first with the model embodying the McKechnie spring frame (for which the above specification of the standard rigid frame short wheelbase model holds good). Instead of the rear wheel being pivoted on the chain stays, in effect the chain stays (and incidentally the power unit, gear box, saddle, and footrests) pivot on the rear wheel, which is held rigidly in relation to the steering head by a cross-braced duplex tubular member. The inner sub-frame, which carries the spring portion, is suspended from the centre of a single long leaf spring, allowing an unusually wide range of vertical movement. Every provision has been made to ensure that the engine unit, etc., does not lose lateral rigidity. All the main working joints are mounted on self-aligning ball bearings.

The standard touring Coventry-Victor is an attractive machine for either solo or sidecar service, while, in view of its success in the 500 Miles Race, the new sports model should appeal to the soloist who craves speed. Footboards and a large silencer are fitted to the touring model; footrests and straight-through pipes to the sports, these being wrapped with asbestos to prevent burning the

Front cylinder of the new 8 h.p. F.N. Noteworthy points are: the operating rod of the inlet valve, which passes through a guide in the induction pipe; the air passage between the exhaust pocket and the cylinder wall; the large offset exhaust tappet; and the taper valve springs.

rider's leg. Naturally, the mudguarding is more extensive on the former.

A fourth Coventry-Victor, with a longer wheelbase, is essentially a sidecar machine.

For the comfort-seeker the spring frame 7.9 h.p. Powerplus Indian is retained, mainly unaltered.

So that the exhaust system on the 3 h.p. F.N. may get the maximum amount of cooling draught, the pipe is led out at an angle; there is also an ample air passage behind the valve pocket.

F.N. (41.)

8 H.P. MODEL.—52×88 mm. (748 c.c.); four-cyl. four-stroke; overhead inlet valves; forced lubrication; Amac carb.; gear-driven mag.; 3-sp. gear; clutch and kick-starter; shaft drive; Clincher 28×3in. tyres. Prices: Solo £155, with sidecar £167.

F.N. (ENGLAND), LTD., Kimberley Road, Willesden Lane, N.W.6.—One of the chief novelties at the Show is the *de luxe* model 8 h.p. shaft-driven F.N., which has the same bore and stroke as its

In several points the new 8 h.p. F.N. differs from the 1921 7 h.p. model. Both engine and gear box have been modified, the former on the lines of the 1914 T.T. machine.

predecessor, but the engine follows closely on the lines of the pattern which competed in the 1914 T.T. races. The overhead inlet valves are situated directly in the centre of the cylinder, and are controlled by means of tappet rods and

rockers. The cylinders have large square fins and ample air passages between cylinders and ports. An important alteration has been made in the design of the change-speed gear, the top gear dogs being in the shape of a Maltese cross, thus ensuring perfect engagement and contact throughout the whole of their surface. The older type of side valve model of the same bore and stroke is retained. The cylinder heels are of T formation and the valves interchangeable. A mechanical oil pump draws oil from a large sump at the bottom of the crank case, and forces it into a tray which forms an oil well beneath each connecting rod big end. The multiple disc clutch is actuated by hand, and is self-contained in the flywheel. A kick-starter is provided. The change-speed gear box combines an exceedingly ingenious cover for the universal joint of the propeller-shaft at its rear.

3 H.P. MODEL.—65×85 mm. (369 c.c.); single-cyl. four-stroke; overhead inlet valves; pump lubrication; Amac carb.; gear-driven mag.; 2-sp. gear; clutch and kick starter; shaft drive; 26×2¼in. tyres. Price, solo £72.

The same procedure has been carried out in the new 3 h.p. F.N. as in the *de luxe* model four-cylinder. More power has been obtained from this engine by placing the inlet valve in the centre of the cylinder. The exhaust valve is set at an angle so as to catch the maximum amount of draught. The top tube is now dropped at the rear so as to give a low saddle position, and fibre-covered foot-

boards are provided. An alternative machine is offered in Model A, which resembles the type just described, except as regards the design of the engine and the fact that the top frame tube is dropped at the rear. The older type of side valve engine is fitted. So far as F.N. sidecars are concerned, these form quite an interesting portion of the exhibit. One body, which is manufactured in Belgium, has beautifully finished and luxurious upholstery, while the wheel is sprung, the spindle being mounted between main springs and recoil springs, so that the rebound is absorbed. A neat limousine sidecar is also exhibited.

INDIAN. (60.)

8 H.P. MODEL.—79.3×100.8 mm. (997.64 c.c.); V twin-cyl. four-stroke; side-by-side valves; mechanical lubrication; Schebler carb.; gear-driven mag.; 3-sp. gear; clutch and kick-starter; spiral gear and chain drive; 750×75 mm. tyres. Prices: Solo £170, with sidecar £210.

HENDEE MFG. CO., LTD., Indian House, 366, Euston Road, N.W.1.—The handsome new Indian Chief is certainly one of the attractions of the Show, as it is

he Olympia Show—

A new Indian model—the Chief, which closely resembles, but is larger than, the popular Scout.

an entirely new model, though somewhat on the lines of the popular Indian Scout. Among the principal features of the Chief's engine are larger radiating fins, which are brought down over the exhaust outlets. There are no bends in the exhaust pipes. The new engine closely resembles the type used for record breaking during the past season. Great

has also been made in the brake transmission, and, owing to the greater leverage obtained, the brake is much more powerful. The electric lighting arrangements are also worthy of study.

gear drive. The mudguarding has been well carried out, and care shown in many other details; for instance, mechanical lubrication, which has been so long a feature of Indian machines. The valve springs are enclosed with telescopic covers.

7 H.P. MODEL.—79.5×100.3 mm. (997.64 c.c.); twin-cyl. four-stroke; side-by-side valves; mechanical lubrication; Schebler carb.; gear-driven mag.; 3-sp. gear; clutch and kick-starter; all-chain drive; 28×3in. tyres. Prices: Solo £150, with sidecar £185.

The spring frame model remains much the same as last year, but such improvements have been fitted as extra wide mudguards, giving adequate protection to the driver.

TRIUMPH. (44.)

3½ H.P. MODEL.—80.9×97 mm. (499 c.c.); single-cyl. four-stroke; four overhead valves; hand pump lubrication; Triumph carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; Dunlop 26×5in. tyres. Price, solo £120.

TRIUMPH CYCLE CO., LTD., Coventry.—

There are few more interesting exhibits in the Show than the four-valve Triumph, a modified model of the machine which has created such a sensation during the past season, and has a number of fine records to its credit. A full description of this interesting design appeared in our issue of October 27th, 1921. This sporting solo Triumph has been designed for

4 H.P. MODEL.—70×78 mm. (596 c.c.); twin-cyl. four-stroke; side-by-side valves; mechanical lubrication; Schebler carb.; gear-driven mag.; 3-sp. gear; clutch and kick-starter; gear and chain drive; Goodyear 26×5in. tyres. Prices: Solo, £139 (fully equipped), with sporting sidecar £169.

The popular Indian Scout has undergone very little alteration for 1922. It is a

Showing the new magneto fitted to the Indian models, with condenser and cover removed.

Three-inch tyres in no way detract from the well-balanced appearance of the new o.h.v. Triumph. The brake pedal is worthy of note.

care has been exercised in the design of the machine, and, as an example of this, it may be mentioned that the kick-starter main bearing passes through a lug in the frame, having a 5in. bearing surface. Following the lines of the Scout, the transmission is by spiral gear wheels of generous dimensions. Some improvement

thoroughly practical two-purpose machine, not at all uncomfortable as a solo mount, the steering being very easy, and the comfort being considerably enhanced by the fitting of a spring seat-pillar. One of the models shown is fitted with the Splitdorf dynamo driven by a leather belt off a pulley from the spiral

hard use, and not merely for speed events. Dunlop tyres with round base rims form part of the equipment. So far as the transmission is concerned, the machine follows standard lines, but higher gear ratios are adopted, these being 4.34, 7.02, and 11.72 to 1. So as to obtain greater controllability during fast touring, Druid forks and W.D. type handle-bars are fitted.

4 H.P. MODEL.—85×97 mm. (550 c.c.); single-cyl. four-stroke; side-by-side valves; hand pump lubrication; Triumph carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2½in. tyres. Prices: Solo £105, with sidecar £145.

The popular 4 h.p. chain-cum-belt drive model remains practically unaltered for 1922. It is an ideal double-purpose machine, being amply powerful for sidecar work and suitable as a solo mount. The same remarks apply to the all-chain model, which, with a gear-box of Triumph manufacture, is offered at £115 solo.

2½ H.P. MODEL.—64×70 mm. (225 c.c.); single-cyl. two-stroke; petrol lubrication; Triumph carb.; chain-driven mag.; 2-sp. gear; without clutch and kick-starter; chain-cum-belt drive; 24×2½in. tyres. Price, solo £65.

A popular two-stroke, which has remained practically unaltered since 1921. An excellent example is shown fitted with the M-L Maglita lighting unit.

Simpler chassis and roomier body are improvements to the Triumph sidecar.

The Olympia Show—

Duplex frame construction of the Omega, showing how the engine-gear assembly and footboards are carried.

OMEGA. (54.)

3 h.p. MODEL.—71×88 mm. (348 c.c.); single-cyl. two-stroke; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. Burman gear; clutch and kick-starter; chain drive; 26×2½ in. tyres. Price £73 10s.

W. J. GREEN, LTD., Omega Works, Coventry.—Undoubtedly the centre of interest on the Olympia stand is the new 3 h.p. two-stroke with its wide duplex frame and ample protection for the rider. New forks in which the unsprung weight is reduced to a minimum, a novel system of tank attachment whereby “drumming” is largely eliminated, and a quickly detachable engine and gear unit are outstanding features, though there are many details which well repay a careful study. Both brakes are of the wedge type acting in dummy belt rims. A two-stroke engine of 348 c.c. is manufactured by the firm, and is a fine piece of work with excellent cooling arrangements.

Power unit of the two-speed 2½ h.p. Ready-Jap, which has a Best mechanical oil pump.

This machine may be fitted with a light sidecar, or for solo purposes may be obtained with two-speed gear.

5-6 h.p. MODEL.—70×88 mm. (680 c.c.); twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. Burman gear; clutch and kick-starter; chain drive; 700×80 tyres. Price £120 15s. solo.

A purely sporting machine, the 5-6 h.p. Omega has a J.A.P. engine installed in a more or less conventional frame. The fittings and finish are excellent, and the specification is admirably suited to the requirements of the fast solo rider. Saddle, tank, large tyres, and all-chain drive are attractive features.

The two-stroke engine before-mentioned is also sold in a conventional frame with two-speed gear and chain and belt drive, the price being £55 13s.; while two J.A.P.-engineed lightweights are obtainable, viz., a 250 c.c. engine with three-speed Sturmey-Archer gear, clutch, and kick-starter, at £78 15s., and a 293 c.c. engine with two-speed gear, clutch, and kick-starter, at £65 3s. These models are both fitted with chain and belt drive.

Many excellent features are incorporated in the 1922 duplex-frame Omega.

READY. (18a.)

5-7 h.p. MODEL.—75×78 mm. (688 c.c.); flat twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; gear-driven mag.; Burman 3-sp. gear; clutch and kick-starter; all-chain drive; 700×80 mm. tyres. Prices: Solo £110, with sidecar £139.

D. READ AND CO., Weston-super-Mare.—Although a great many machines may make use of the same component parts, almost every make has one or two quite distinctive points. On the Ready motor cycles—newcomers to Olympia, but not new to the road—perhaps the most interesting feature is the silencing arrangement, which is shown in different forms but embodying the same patented “internals.” These consist of one or two truncated cones, copiously drilled and the narrow diameters facing the engine. When two of these cones are used, a small bore pipe runs through the centre, serving to support the baffles. The overall dimensions of this silencer are not at all unwieldy, and a considerable degree of silence, with a minimum of back pressure, is claimed. For the rest this model, which is shown as a sidecar outfit, is adequately described in the specification. The engine, of course, is a Coventry Victor. It is worthy of note, however, that reinforced double duplex down tubes are used in the frame, making actually four front down tubes. The

The silencer that fits into the end of the exhaust pipe of the Ready motor cycle, and which can be detached and cleaned easily.

Bax sidecar fitted has an all-metal body and coil rear springing.

2½ h.p. MODEL.—70×76 mm. (293 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; chain-driven mag.; Burman 2-sp. gear, without clutch and kick-starter; chain and belt drive; 26×2½ in. tyres. Price, solo £61.

Although shown in three forms, the lightweight Ready machines have, generally the same specification throughout. For example, the above model is also offered with a clutch and kick-starter at £65, and with a three-speed gear box at £68. Similarly, a 350 c.c. J.A.P.-engineed three-speed model is priced at £78.

L.S.D. CYCLE CAR. (138.)

8 h.p. MODEL.—85½×85 mm. (976 c.c.); twin-cyl. four-stroke; side-by-side valves; pump and drip feed lubrication; Amac carb.; chain-driven mag.; 2-sp. and reverse gear; clutch and handle starter; shaft and chain drive; 26×3 in. tyres. Price £165.

SYKES AND SUGDEN, LTD., Linthwaite, Huddersfield.—The L.S.D. cycle car has been developed on the rough setts and macadam of the Yorkshire mill area, and has thus been designed to tackle continuous hard work without giving any

The Olympia Show—

A three-wheeler that has been thoroughly tried out: the L.S.D., fitted with J.A.P. air-cooled engine and final chain drive.

trouble. Fitted with either J.A.P. or M.A.G. 8 h.p. engine, it drives through a clutch and propeller-shaft to a gear box amidships. The two forward speeds are controlled by a side lever, and the reverse is controlled by a separate lever mounted on the front of the driving seat, the main lever being immovable when the reverse is in operation. The sturdy construction of the frame is an index to the character of the machine, for the main frame is composed of angle steel welded together, no bolts being used, and stiffened by deep oak side pieces, which are thoroughly well braced. The engine is started by means of a long pedal prominently mounted on the near side and engaging the layshaft, which gives a multiplication of 2 to 1. The steel artillery wheels are detachable and interchangeable, the rear wheel mounting being particularly neat; on slackening the rear spring nuts and rotating the rocking washers, the rear wheel drops out; on removing the five bolts securing the wheel, the hub falls into two halves, and the wheel comes away. Front springs are of the enclosed coil type. With acetylene lighting and full road equipment, this three-wheeler is priced at £165, option being given between the two-seated touring body and the commodious light delivery van.

N.U.T. (140.)

3½ h.p. MODEL.—64.5×76 mm. (498 c.c.); V. twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; Lucas chain-driven mag.; Sturmey-Archer 3-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2½ in. tyres. Prices: Solo £100, chain drive, £110.

HUGH MASON AND CO., LTD., Derwenthaugh, Newcastle-on-Tyne.—Very little alteration has been found necessary in

Bayonet caps, detachable for speed events, on the end of the exhaust pipes of the N.U.T. sports model.

the 3½ h.p. J.A.P.-engine N.U.T., which was designed essentially as a smooth-running speedy solo mount; all-chain drive, however, is now offered as an alternative to the original chain and belt layout. A small item of the specification is the leading of the crank case relief valve outlet from the timing gear to the primary chain case, thus keeping the engine cleaner, and at the same time lubricating the chain. Generally, the policy of the designer is to clean up details and to aim at standardising nut and bolt sizes, etc. A well thought out toolkit has been got together, and an oil gun is carried in the handle-bar stem,

An electrically equipped model of symmetrical and compact appearance—the 5.6 h.p. N.U.T.

while a squirt is fitted in the petrol-filler cap.

A sports model is also staged, having the latest type of J.A.P. engine, with improved cylinders and "fir-cone" valve caps. This model is of the stripped variety, with no carrier, narrow guards, and long exhaust pipes, the latter having bayonet fitting end caps for ordinary riding. The driving and magneto chains are guarded on the top runs only; this machine costs £125 in the all-chain model with close ratio gear box and no kick-starter.

Another machine following exactly the same specification, but having a 70×88 mm. (678 c.c.) twin J.A.P. engine, is staged with a light sidecar; this model is an admirable double-purpose mount, and follows the usual graceful outlines and pleasing finish of its forerunners.

With chain drive the price is £120, the sidecar costing £30 extra, and a Magdyno may be had on all touring models at £20 extra.

A well thought out sidecar chassis is fitted, this being coupled to the machine by means of ball and socket joints per-

Carburettor side of the 370 c.c. Connaught. Observe the Showell oil pump on the magneto chain case and its leads.

mitting a considerable amount of flexibility, and rendering severe bending stresses on the connections almost impossible.

T.B. (29.)

8 h.p. MODEL.—85×88 mm. (986 c.c.); V. twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac or B. and B. carb.; gear-driven mag.; 3-sp. and reverse gear; clutch; shaft drive; 700×80 mm. tyres. Price £215.

THOMPSON BROS. (BILSTON), LTD., Bradley Engineering Works, Bilston.—It is difficult to classify the T.B., except under the very general heading of "three-

New method of attaching the front springs on the T.B. three-wheeler.

The Olympia Show—

wheeler." While the sliding pinion type of gear box and the final shaft transmission are typically automobile practice, the engines are all V twins closely allied to motor cycle design. Although tubular, the chassis is braced in such a manner as to be equal to the most severe road stresses. Rear springing is by a pair of semi-elliptic springs acting, however, more on the cantilever principle. In front there are two quarter-elliptic springs with an improved mounting. All three wheels are interchangeable. The model specified above is water-cooled, but an air-cooled engine may be fitted to the same chassis, when the complete car sells at £175, less spare wheel.

Two types of the water-cooled model only are shown with bodies, the second being a *de luxe* machine finished in blue (with a guaranteed nickel silver bonnet) and fitted with a speedometer and dashboard lamp. The price in this case is £235. All the T.B.'s have a separate Lucas dynamo lighting outfit, and all of them also weigh less than 8 cwt. Screens and hoods are, of course, standard.

EDMUND. (132.)

2½ H.P. MODEL.—71×88 mm. (348 c.c.); single-cyl. four-stroke; side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 2-sp. or 3-sp. Burnan gear; clutch and kick-starter; chain or combined drive; 26×2¼ in. tyres. Prices: Solo from £75, with sidecar £23 10s. extra.

EDMUNDS AND Co., Milton Works, Milton Street, Chester.—The chief

The neat saddle mounting on the Sporting Edmund.

novelty on the Edmund stand consists of the application of the firm's suspension system to chain drive. Not only is the frame extremely rigid laterally, but it can be adjusted in a few minutes to suit any variations of load. On this stand

An attractive sports model Edmund with 2½ h.p. Blackburne engine and three-speed gear. Although no carrier is fitted, there is a capacious tool-bag.

The latest pattern 10 h.p. T.B. three-wheeler, with water-cooled engine, three-speed gear, and reverse.

are staged several touring models fitted with J.A.P. or Blackburne engines, and either of chain or combined drive. There is also a 4¼ h.p. touring model with Blackburne engine, designed to relieve the single-cylinder sidecar enthusiast from road vibration. A saddle tank is fitted.

2½ H.P. MODEL.—71×88 mm. (348 c.c.); single-cyl. four-stroke; side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 2-sp. or 3-sp. Burnan gear; clutch and kick starter; chain or combined drive; 26×2¼ in. tyres. Price, solo £90.

Perhaps the most interesting machine in the exhibit is the 2½ h.p. sports model with Blackburne engine. The handlebar is underslung so that the driver can get his head well down; this creates difficulties in carrying accessories, so a special quickly detachable "accessory bar" is mounted in the steering head, and can be withdrawn in a few minutes complete with lamps, speedometer, etc. The speedometer drive is interesting, the large pinion being mounted on the flange of a Webb brake, while the small pinion is mounted so as not to interfere with the removal of the wheel. A Bowden lever on the handlebar controls the oil pump. Internal expanding brakes are fitted to both wheels, and the tools are carried in a single

capacious bag under the saddle. All the Edmund machines are very handsomely finished in black and gold, and have saddle type petrol tanks of very large capacity. From the appearance point of view, the little sports model is one of the most attractive of its type.

MONTGOMERY SIDECARS. (55.)

W. MONTGOMERY AND Co., Coventry.—The *modèle de luxe* Montgomery sidecar is certainly an attractive proposition. It is mounted on a special chassis, is beautifully finished, well upholstered, and has a Triplex glass screen mounted on a hinged scuttle. A cover is supplied to protect the body when unoccupied by a passenger, and a hood with hood cover is provided. There is a large locker at the rear. The type known as No. 1 is not quite so luxuriously fitted

A new type Montgomery sidecar with apron and screen, notable for its deep upholstery.

up as the model just referred to, but is a thoroughly comfortable sidecar. The sporting sidecar is of aluminium varnished over, and is of quite attractive appearance. A lightweight model is mounted on a chassis composed mainly of the rear axle, an extension to the front tube, and another connecting it to the saddle tube of the motor bicycle frame. This forms a triangular frame attached to the machine at three points. A speciality is made of painting sidecars in the colours of well-known public schools to which their purchasers may belong. Weather protection by means of aprons and windscreens has received much attention.

The Olympia Show—

CASTLE THREE. (26.)

10 H.P. MODEL.—62×100 mm. (1,207 c.c.); four-cyl. four-stroke; side-by-side valves; mechanical lubrication; Solex carb.; Smith combined ignition and lighting generator; epicyclic 2-sp. and reverse gear; shaft and bevel drive; 26×3in. tyres. Price £225.

CASCADE MOTOR CO., LTD., Kidderminster.—Excepting that it has only three wheels, the Castle Three runabout bears no relation to the motor cycle—and even the wheels are of the artillery pattern! It has the only water-cooled four-cylinder engine in the Show, and the vehicle complete with a commodious body of striking appearance is not at all unwieldy. The other big point wherein the Castle Three differs from the rest of the

Showing the special hinged joint between the rear springs and back axle of the Castle Three. This feature provides extra flexibility in the rear springing.

three-wheelers is that the rectangular pressed steel chassis completely encloses the rear wheel, which is supported on long, semi-elliptic springs. This does not interfere with the detachability of the wheel, however; all three are interchangeable, and a spare is supplied. A transverse spring is fitted in front. Accessibility and ease of removal are strong points in the layout of the engine and gear box. Lubrication is on approved automobile lines—pump and trough—and there is even an oil pressure gauge on the well-equipped instrument board. Cooling is on the usual thermo-siphon principle, and the radiator is of handsome contour, blending well with the body lines. The price specified above includes very complete equipment.

Chief improvements for next year lie in the addition of diagonal bracing members to the chassis and a new universal joint in the transmission. Much friction is avoided by the efficient lubrication of this joint, which is ingeniously effected by a single grease cup.

The complete car shown has a dickey seat—a £5 extra.

With folding dickey seat and spare wheel, the four-cylinder water-cooled Castle Three is an attractive model.

With this low-built and fairly roomy sidecar, the 2½ h.p. Radco is converted into an attractive light passenger machine.

RADCO. (37.)

2½ H.P. MODEL.—67×70 mm. (247 c.c.); single-cyl. two-stroke; sight drip feed lubrication; B. and B. carb.; chain-driven mag.; Burman 3-sp. gear; clutch and kick starter; chain-cum-belt drive; 24×2¼in. tyres. Price, solo £42.

E. A. RADNALL AND CO., Dartmouth Street, Birmingham. — Last year the

Universal joint on the shaft transmission on the Castle Three. A single grease cup lubricates all four bearings of the joint.

Radco was shown for the first time with an engine of slightly increased capacity, but even now, at 247 c.c., it is by no means an oversize in two-stroke lightweights. The design of the whole machine is also on the simplest lines, and, therefore, the small sidecar outfit exhibited must necessarily be among the lightest and least complicated at the Show. It is by no means the least fully equipped, however; nor is the sidecar fitted the most absurdly small. The body has an extremely rakish appear-

ance, accounted for by its low position on an outfit with only 24in. wheels. A surprisingly capacious locker is embodied in the streamline-tail, and aluminium disc wheels and an M-L Maglita add to the usefulness and completeness of the specification.

Another new departure for this year is the ladies' open frame model, which differs from the above by having an inclined engine, dressguards over the belt and power unit, and a two-speed Burman gear box with clutch and kick starter. This model is priced at £57 15s.

Also shown is a utility model, in several variations, with petrol lubrication. In all, nine models are staged.

POWELL. (21.)

4 H.P. MODEL.—85×96.5 mm. (547 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amal carb.; M-L chain-driven mag.; Sturmey-Archer 3-sp. gear; clutch and kick starter; chain and belt drive; 26×3in. tyres. Prices: Solo £107, with sidecar £135.

POWELL BROS., Wrexham.—This is the Powell's first appearance at Olympia, but there have

The 4 h.p. Powell has been improved in many details for 1922.

been, nevertheless, several important improvements since it was first described in *The Motor Cycle* last year. The timing gear has been entirely redesigned; there are now two separate cams, and it is claimed that the new arrangement renders it perfectly noiseless. The pinions run in an oil bath, for the main oil lead to the engine goes first to the timing case. From there it finds its way into the crank case sump, where it is picked up by the big end, which, as the engine is inclined, reaches to a lower level in the crank case than it would if the cylinder were vertical. Centrifugal force sends the lubricant from the crank

The Olympia Show—

Rear brake operation on the 4 h.p. Powell—a newcomer to Olympia.

webs into the big end plain bearing. The main bearing on the outside flywheel side is of the double-row Skefko type, pressed into a bronze bush which in turn is held in the crank case by studs. This prevents difficulties with a ball bearing cage that may be too small for, or loose in, its housing. An exceptionally neat exhaust lifting mechanism, which involves only one additional part, and a swivelling magneto bracket, providing easy chain adjustment, are other improvements to the power unit. The detachable cylinder head is retained. An aluminium silencer with an extended exhaust pipe, a top rail tool box of the same metal, and a more comfortable shape of handle-bar are the chief changes in the machine itself. A chain-driven model at £110 could not be prepared in time for exhibit.

Combined footboard and footrests of the Powell.

REYNOLDS. (73.)

2½ h.p. MODEL.—70×70 mm. (269 c.c.); single-cyl. two-stroke; drip feed lubrication; Cox carb.; direct driven mag.; 2-sp. gear; clutch and kick-starter; chain drive; 24×2½ in. tyres. Price, solo £78 15s.

A. W. WALL, LTD., Tyseley, Birmingham.—Already well-known by reason of its unorthodox appearance the Reynolds may be regarded as a

"Comfort first" must have been the maxim of the designer of the de luxe tandem Reynolds runabout. A 2½ h.p. J.A.P. engine and Burman three-speed gear are used.

useful type of machine for the man who requires a mount for runabout purposes. With its open frame and comfortable sprung bucket seat it is particularly suitable for lady drivers, or for those who

quarter-elliptic springs are anchored to the rear of the frame, and support at their forward ends the front of the platform on which the driver's seat is mounted. A second bucket seat can be accommodated at the rear end of the platform if need be. A very easily operated rear wheel stand is another interesting point.

2¼ h.p. MODEL.—70×90 mm. (349 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; Cox-Atmos carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½ in. tyres. Price £105.

As a de luxe passenger machine the larger edition of the Reynolds runabout has many attractive features; for instance, the weight and space of a sidecar outfit is saved. A very complete specification includes Maplestone forks, internal expanding brakes in both wheels, and fully sprung bucket seats for both driver and passenger. Beautifully finished in every detail, the floor and running boards are covered with rubber and have moulded beadings. Either seat is suitable for a lady, since there are no tubes to interfere with dress position. The tubular frame is reinforced at the bends, and the whole machine presents a novel appearance which attracts much attention from the general public.

LEA-FRANCIS. (39.)

3½ h.p. MODEL.—64×77 mm. (496 c.c.); V twin-cyl. four-stroke; overhead inlet valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½ in. tyres. Prices: Solo £110, with sidecar £135.

LEA-FRANCIS, LTD., Lower Ford Street, Coventry.—A useful double-purpose mount of moderate horse-power, quite ideal for solo use, and yet capable of taking a sidecar with ease and comfort, is the

On the Liberty two-stroke engine fitted to the Jupp and the Reynolds runabout, the magneto is driven by an extension of the crankshaft.

take up motor cycles late in life. It is extremely well mudguarded, and with its Liberty two-stroke engine, two-speed gear and chain drive, it is essentially a sturdy little machine capable of hard work and quite suitable for long runs when occasion arises. The springing of the seat platform is particularly interesting, for long

A Lea-Francis sporting model is now available with a 3½ h.p. engine.

The chain-driven Zenith-Bradshaw, the silencing arrangements of which have been amended for the Show.

The Olympia Show—

3½ h.p. V twin Lea-Francis. Among the chief features may be mentioned the entirely enclosed chains, the flexible tubing exhaust pipes, and the three-speed gear enclosed on a circular bottom bracket. Throughout the design, the rider's comfort has been carefully studied. The footboards are of ample size, and running transversely across them is a metal guard made in one with an under-shield—a very excellent idea, which not only protects the rider's feet, but also the

That simple lines may result in a graceful whole is exemplified on the redesigned 2½ h.p. Levis.

What first strikes the eye on the 5 h.p. model is the workmanlike appearance of the handsome cast sand-blasted aluminium chain case, which also encloses the countershaft clutch. There is a neatly arranged inspection cover through which the adjustment of the chain may be verified. A normal type of three-speed gear is mounted above its bracket instead of being hung from a bracket as is more usual. The rear chain guard is of sheet metal, and excellent mudguarding is provided. In this case the magneto is carried at the front of the engine, but is perfectly protected from wet.

LEVIS. (67.)

2½ h.p. MODEL.—67×70 mm. (247 c.c.); single-cyl. two-stroke; drip feed lubrication; Senspray carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain-cum-belt drive; 24×2¼ in. tyres. Price, solo £68.

BUTTERFIELDS, LTD., Stechford, Birmingham.—The above is the most fully-equipped form of Levis. It is a thoroughly practical lightweight capable of going anywhere. It has a sloping top tube which greatly enhances its appearance, while the tank is supported on a detachable platform. The front chain is protected by a guard, the side of which is also extended to protect the greater portion of the top run of the belt. The same model is shown in a simpler form single geared.

2½ h.p. MODEL.—62×70 mm. (211 c.c.); single-cyl. two-stroke; drip feed lubrication; B. and B. carb.; chain-driven mag.; 2-sp. gear; clutch; chain-cum-belt drive; 24×2¼ in. tyres. Price, solo £58.

A very useful lightweight, sold at a moderate figure, the weight

of the 2½ h.p. is only 135 lb. If fitted with a two-speed gear, no district in Great Britain need be closed to it. The lubrication follows a principle adopted by Messrs. Butterfields for some considerable period, leading the oil from the Best and Lloyd drip feed to the cylinder and main bearings, whence it passes to the big end through a drilled crankshaft. On this, and on the model just described, a simple form of direct-acting heel-operated brake is fitted.

The Levis Popular is a replica of the foregoing model, except that no two-speed gear is fitted. It weighs only 120 lb., and is sold to the public at £48.

QUADRANT. (22.)

4½ h.p. MODEL.—85×110 mm. (624 c.c.); single-cyl. four-stroke; side valves; hand pump lubrication; Amiac or Senspray carb.; gear-driven mag.; Sturmey-Archer 3-speed gear; clutch and kick-starter; all-chain drive; 26×2¼ in. tyres. Prices: Solo £85, with sidecar £105.

QUADRANT MOTORS, LTD., Lawley Street, Birmingham.—As a thoroughly tried and amply powerful sidecar outfit, at a very reasonable price, the 4½ h.p. Quadrant occupies a secure position in its class. Allowing for its large capacity—large, that is; for a single—the engine possesses quite a remarkable top gear performance. At a casual glance, too, it

Made of aluminium, this novel double expansion chamber replaces the "canister" type of silencer on the Quadrant.

impresses one as being cleanly and soundly designed. Mechanically, its only unconventional feature is in the position of the inlet valve behind the cylinder and the exhaust midway at the side; and this may account in no small measure for the engine's cool running and "slogging" capabilities. Instead of the old canister type of silencer hanging across just in front of the crank case, two neat aluminium expansion chambers are fitted,

New arrangement of footboards and mud-shield on the Lea-Francis machine.

mechanism from mud and wet. The magneto is neatly stowed away at the rear of the engine, and is in a most thoroughly protected position.

The sports model is a most attractive little mount fitted with wide handle-bars, narrow and lighter mudguards, a totally enclosed front chain, and a rear chain protected by a guard. Footrests instead of footboards are supplied. In all other respects this machine resembles the 3½ h.p. pattern just described. M.A.G. engines are used throughout Lea-Francis models, which are conspicuous for their business-like appearance and excellent all-weather finish in which the plating has been reduced to a minimum.

5 h.p. MODEL.—64×92 mm. (592 c.c.); V twin-cyl. four-stroke; overhead inlet valves; drip feed lubrication; Amiac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; all-chain drive; 26×3 in. tyres. Prices: Solo £125, with sidecar £157 10s.

An exceedingly attractive big single Quadrant outfit marketed at a popular price.

The Olympia Show—

forming bulges in an open exhaust pipe which leads to the rear of the machine. Another noticeable detail improvement has been effected by rounding off the saddle tank. Quadrant spring forks, which are of conventional design, but embody a recoil spring, are retained, as is an ordinary horseshoe type front rim brake. Aluminium chain cases are fitted to both chains, and on the chain-cum-belt model (which costs £5 less) to the primary drive. There is a transmission shock absorber in the rear hub of the chain-driven machine. The sidecars shown are commodious and strongly built, and have capacious lockers at the rear.

NEW IMPERIAL. (69.)

2½ h.p. MODEL.—70×76 mm. (293 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½ in. tyres. Price, solo £73.

NEW IMPERIAL CYCLES, LTD., Princip Street, Birmingham.—Of particular interest amongst the range of New Imperial models is the light tourist all-chain drive with a special J.A.P. engine. Simplification and refinement of detail

Amongst the most attractive of the big outfits—the 8 h.p. New Imperial, with dynamo lighting and a very completely equipped sidecar.

are the keynotes of the design, for the engine and gear box unit are mounted in a loop frame, of which strength and lightness are distinct features. A shock absorber is incorporated on the engine-shaft. A refinement is seen in the method of rear brake adjustment by means of a wing nut on the end of the tension rod. Internal

expanding brakes are fitted to both wheels. Very neat legshields are attached to the front of the aluminium footboards, and serve also to deflect air on to the engine.

This model is also obtainable with 24 in. wheels at the same price, and in this guise it makes an exceedingly attractive little machine. It can also be obtained as a sporting model with a 250 c.c. engine and minus kick-starter at £80, or with a 350 c.c. engine at £84. It

was a 250 c.c. New Imperial that won *The Motor Cycle Cup* in the last T.T.

A somewhat similar model is available with chain-cum-belt transmission, but without the loop frame, the price of which is £69, or without kick-starter £63.

8 h.p. MODEL.—85.5×85 mm. (986 c.c.); twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×3 in. tyres. Price, with sidecar £145.

A lady's miniature two-stroke, the 1½ h.p. J.E.S.

A very long V type shoe is used on the 8 h.p. New Imperial rear brake.

To the family man the sidecar model will appeal by reason of its sturdy construction, although refinement is not lacking, as instanced by the fitting of Timken roller bearings to the back wheel. A spring seat-pillar ensures the comfort of the driver, while the passenger is adequately provided for by deep, well-sprung upholstery, and, if desired, by a hood, screen, and side curtains, which transform the sidecar into a coupé, the extra cost being £9.

Of interest to the sporting rider is the 8 h.p. sports model with a special J.A.P. engine, having lightened reciprocating parts and aluminium pistons. The kick-starter is omitted on this machine, the price being £132.

J.E.S. (59.)

1½ h.p. MODEL.—60×60 mm. (169 c.c.); single-cyl. two-stroke; drip feed lubrication; J.E.S. carb.; gear-driven mag.; 2-sp. gear, without clutch and kick-starter; belt drive; 24×2 in. tyres. Price, solo £48.

J. E. SMITH, LTD., J.E.S. Works, Gloucester.—Weighing only 98 lb., this is a very interesting little lightweight, and one of the genuine variety. It is

On the J.E.S. lightweight, a two-speed gear is incorporated in the crank case, operated by a rod through the mainshaft.

Interesting to note the fact that it incorporates a two-speed gear in the engine. In top gear the pulley is running at the same speed as the crankshaft, but when on low gear the drive is taken through a train of gear wheels on a countershaft mounted underneath the crankshaft, giving a 45% reduction. The gear is quite unobtrusive. Other attractive features of this machine are

Another open frame mount—the 2½ h.p. Jupp two-stroke.

The Olympia Show—

the lubrication by drip, which is actuated by pressure in the crank case leading oil to the hollow crankshaft and web to the crank pin, then through the centre of the connecting rod directly to the hollow gudgeon, and thence to the cylinder walls.

The single-speed model is a simplified replica of the machine just described. It weighs 88 lb., and costs £38.

1¼ h.p. MODEL.—60×60 mm. (169 c.c.); single-cyl. four-stroke; automatic inlet valves; pressure feed lubrication; J.E.S. carb.; gear-driven mag.; 2-sp. gear, without clutch and kick-starter; belt drive; 24×2in. tyres. Price, solo £49.

This machine closely resembles the two-stroke, two-speed model previously described, but is fitted with a four-stroke engine, which, like the two-stroke, incorporates the two-speed gear in the crank case. The engine is fitted with an automatic inlet valve, as Mr. J. E. Smith is a strong supporter of the modern form of this type of valve. The chief feature of this valve is its large diameter. It is fitted with two springs—a light spring enabling it to open at the slightest suction, and a stiff spring to ensure its rapid closing at high speeds, and to form a stop to prevent the shearing of the cotter. The crank case can be taken apart in the case of this engine without interfering with the magneto timing. It is also worthy of note that the pedalling gear in this machine can be used either for kick-starting when the stand is up or alternatively for assisting the engine, while by undoing a stop the pedals may be brought level and used as footrests.

The lady's model is certainly an interesting proposition. The frame is built on the same principle as a lady's pedal cycle. It is provided with an efficient belt guard and special valances to the rear guards, so as to keep the rider's skirt free from mud and clear of the transmission.

READING-STANDARD. (18.)

8-10 h.p. MODEL.—85.5×101.6 mm. (1,170 c.c.); V twin-cyl. four-stroke; side-by-side valves; mechanical pump lubrication; Schebler carb.; gear-driven mag.; own 3-sp. gear; clutch and kick-starter; all-chain drive; 28×3in. tyres. Prices: Solo £135 (with dynamo lighting), with sidecar £175.

COPPEN, ALLAN AND CO., 89, Great Portland Street, W.1. — Probably the most noteworthy feature of the Reading-Standard is the large capacity of its engine, although in America, whence it hails, such so-called "oversize"

power units are proportionately as common as 250 c.c. lightweight in this country. The machine is, therefore, in no sense a freak, and, indeed, in general lines, is exceedingly conventional, the design being a blend of standard American and British practice, but mainly the former. It may be recollected, however, that the Reading-Standard was the first American machine to make an appearance on the British market with side-by-side valves. It was also one of the earliest designs to embody completely enclosed valve springs and tappets. Such typically American features as twist grip control and interconnected hand and foot clutch operation naturally find a place in the specification; and—another excellent idea from across the Atlantic—the tank holds 3½ gallons of petrol. Mudguarding has been improved since last year, and a transmission shock absorber is now fitted at a slight extra cost. The prices in both cases include dynamo lighting.

With dropped handle-bars, higher gear ratios, and a handle-bar clutch control (making three alternative methods of clutch operation), the same model is sold as a sporting solo or sidecar mount. The standard single-seated sidecar is an M.P., but one machine is also shown with a "Plus One" tandem sidecar attached. With the latter sidecar (single or two-seated at will) the price is £188.

DUNHILL SIDECARS. (68.)

DUNHILLS, LTD., 359, Euston Road, N.W.1.—Sidecars for every power and type of machine are offered by this well-known firm. Ten different models are on show, but three merit particular attention, as they have been but recently introduced. Of these, the featherweight model is particularly attractive, and with its simple triangulated frame and robust construction, it should be capable of good service. The triangulated frame construction is a speciality of Dunhill's productions, and is seen in varying degrees of strength on the other models. In the new touring model

Nominally one of the most powerful motor cycles on the British market—the 8-10 h.p. Reading-Standard.

A new triangulated underslung chassis is a feature of the Dunhill bulbous back touring sidecar.

and in the new two-seater model it is observable how the frame is strengthened up by additional cross members. The two-seated model exhibited is particularly sturdy, and provides ample accommodation for two passengers sitting tandemwise. One very good feature of all these sidecars is the strength and rigidity of the mudguard, which is held by three stout tubular stays. On all models, from the lightest to the heaviest, springs from the famous house of Terry are fitted, and a refinement on the large two-seater model is the provision of a very neat wheel stand, which, when out of use, hinges up and forms an additional support for the mudguard.

"Carbjector" silencer fitted on the tail of the exhaust pipe of the two-stroke Velocette.

VELOCETTE. (36.)

2¼ h.p. MODEL.—62×73 mm. (220 c.c.); single-cyl. two-stroke; mechanical lubrication; Amac carb.; gear-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 24×2½ (for 2½ in.) tyres. Price, solo £72 10s.

VELOCE, LTD., Victoria Road, Aston, Birmingham.—For nearly a decade now the resources of the Velocette factory have been concentrating on one type—almost one model—of motor cycle, and; although this year's trials have proved the 1921 machine to have reached an advanced stage of development, the makers are by no means content to rest on their laurels. A new three-speed gear box, with clutch and kick-starter, modifications to the internal expanding rear brake, more accessible chain cases, and wider front forks are among the points that will make the 1922 Velocette even better than its predecessors. A self-contained mechanical pump lubrication system, embodying a crank case sump, has long been a satisfactory feature, and, generally speaking, the power unit is quite unaltered. Pedal cycle type "lubricators" have been discarded in favour of generous grease cups, and a most interesting silencer known as the Carbjector is fitted. It is claimed that, far from causing back pressure, this device actually assists in scavenging the cylinder. A

The Olympia Show—

Brooks cantilever saddle is fitted to this model, but on the two-speed gear machines the seat is one of the new pattern Terry spring top saddles. Other Velocette models are priced as follows: With two-speed gear, with clutch and kick-starter, £65; a similar lady's model, £63; a two-speed (50 m.p.h. guaranteed) sports model, with 249 c.c. engine, £68. A Maglita combined lighting and ignition set may be fitted as an extra.

NORTON. (99.)

3½ h.p. MODEL.—70 × 100 mm. (490 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; B. and B. or Binks rat-trap carb.; chain-driven mag.; Stummer-Aicher 3-sp. gear; clutch and kick-starter; chain drive; 26 × 2½ in. tyres. Price, solo £115.

NORTON MOTORS, LTD., Bracebridge Street, Birmingham.—Probably the most interesting exhibit on the Norton stand is the stripped racing model with B.S. engine, open chain drive, and Binks rat-trap carburetter. This machine is sold with a guarantee that it has exceeded 75 m.p.h. on Brooklands. This engine can be supplied with any model at an extra charge of £22, while the B.R.S. engine (70 m.p.h. guarantee) can be fitted at an extra charge of £12.

Another interesting model is the 3½ h.p. Colonial, which has a crank case clearance of 6 in. Chain adjustment is effected by means of a single nut occupying an accessible position at the rear of the gear box brackets. Domed nuts are fitted throughout. The price of this model is £117.

On the £115 16H 3½ h.p. a lower riding position is obtained by reducing the ground clearance to 4 in., but in other respects it is almost a counterpart of the Colonial.

The Model 9 5½ h.p., single gear, direct belt drive will appeal specially to the lover of a fast and simple machine. A straight through exhaust is employed. The standard ground clearance is 4 in., but a Colonial design, having a clearance of 5 in., can be supplied. A Philipson pulley is fitted at an extra charge of £7 7s. Price £80.

4 h.p. MODEL.—82 × 120 mm. (634 c.c.); single-cyl. four-stroke; poppet valves; hand pump lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 650 × 65 mm. tyres. Prices: Solo £120, with sidecar £154.

The almost classical Big Four sidecar model is shown variously equipped both for touring and commercial purposes. The No. 1 touring is fitted with oil-tight chain cases, special aluminium footboards, and artistic legshields (£2 2s. extra). An electrically equipped sidecar outfit, fitted with Lucas Magdyno (£21 extra) is a centre of interest, the handsome

In addition to the Sun rotary-valved two-stroke, this 293 c.c. J.A.P.-engine model will be marketed

outfit being provided with a specially attractive sidecar containing a folding seat for a child. On all Norton models adjustable tappets are now standard.

SUN AND SUN-VITESSE. (72.)

2½ h.p. MODEL.—70 × 70 mm. (269 c.c.); single-cyl. two-stroke; rotary valve; drip feed lubrication; Amc carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26 × 2½ in. tyres. Prices: Solo £61 19s., with Maglita lighting and ignition 196 12s.

SUN CYCLE AND FITTINGS CO., LTD., Aston Brook Street, Birmingham.—Of the

two models shown, the Sun-Vitesse two-stroke perhaps attracts the greatest attention by reason of the rotary valve with which it is fitted. This valve is formed on the right-hand side of the engine, and takes the form of a disc, in which is a suitably shaped port, working against the cast iron end plate of the crank case. In this

plate is incorporated the induction pipe and port. On the flywheel side of the engine is a piston-operated air valve under the control of the driver through the medium of a Bowden wire.

An excellent idea of the action of this valve may be gained by an

Section of the Sun engine, showing the rotary inlet valve in the crank case.

examination of a sectional engine which is exhibited. As a sidecar outfit, the Sun-Vitesse is particularly attractive, for it affords an example of the cheapest form of motoring for two. With all-chain drive

and a three-speed gear, it should be capable of a good road performance. The price of this little outfit with magneto lighting and ignition is £95 12s. An innovation, so far as the Sun is concerned, is the 2½ h.p. J.A.P. model, the main specification being the same as that of the Sun-Vitesse. Both two and four-stroke engine machines are available with two or three-speed gears, the price of the two-speed J.A.P.-engine machine being £63. A normal three-port two-stroke model is also listed with similar specification to that described above.

HAWKER. (25.)

4¼ h.p. MODEL.—85 × 97 mm. (548 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; B. and B. carb.; M.L. chain-driven mag.; Barnum 3-sp. gear; clutch and kick-starter; all-chain drive; 26 × 2½ in. tyres. Price, solo £89 15s.

H. G. HAWKER ENGINEERING CO., LTD., Kingston-on-Thames.—Considering the familiar ring the name now has in the ears of the average motor cyclist, it is somewhat surprising to recollect that the Hawker had not made its appearance at the time of the last Show. This model, however, is quite new, although the frame follows very closely the lines of the 1921 two-stroke type. The engine is a standard Blackburne. Internal expanding brakes are fitted to both wheels, and the Hawker type of saddle mounting is used, the saddle-pillar being entirely dispensed with, since the seat portion is hinged on the top tube in front and supported on coil springs attached directly to the frame stays in the rear. The carrier and cylindrical metal tool box forms another instance of the aim of the designers—simplification of production. Druid type forks are fitted to this model.

(Left) On the 1922 three-speed 3½ h.p. Norton a silencer is fitted instead of the plain exhaust pipe. (Right) A popular single-cylinder sidecar mount—the "Big 4" Model

The Olympia Show—

Other four-stroke models with Blackburne engines shown are a $2\frac{3}{4}$ h.p. type with plain two-speed gear (£75 12s.), and clutch and an o.h.v. sports model with all-chain drive through a three-speed box (£99 15s.).

$2\frac{1}{2}$ h.p. MODEL.—70×76 mm. (293 c.c.); single-cyl. two-stroke; crank case pressure lubrication; Claudel carb.; flywheel mag.; 2-speed gear; chain-cum-belt drive; 26×24in. tyres. Price, solo 50 gns.

Whatever else the Hawker lightweight does it will always be remembered for hauling a sidecar and passenger up the six mile climb at Applecross. unaided. Its *motif* is simplicity, and it was not expected that it would show much change on its first appearance at Olympia—for it certainly could not be simplified much more! With its flywheel magneto and twin chain and dog clutch gear it truly deserves the title of lightweight. It differs from the new "4 $\frac{1}{4}$ " in its brakework—two on the rear belt rim—and its forks, of the hinged (barrel spring) type.

VERUS AND SIRRAH. (133.)

5-6 h.p. MODEL.—71×88 mm. (696 c.c.); V twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; M-L chain-driven mag.; 3-sp. gear; clutch and kick-starter; Sturmev-Archer 3-sp. gear; clutch and kick-starter; chain drive; 26×31in. tyres. Prices: Solo £135, with sidecar £162 10s.

ALFRED WISEMAN, LTD., Glover Street, Birmingham.—The 5-6 h.p. Verus (which

Aluminium plates neatly cover the gap for the fork blades in the front mudguard of the 5-6 h.p. Verus.

fork blades, aluminium plates sealing the apertures. Cast aluminium is also used for the magneto shield, footboards, and the complete chain cases, which are massive and amply provided with inspection plates.

$2\frac{1}{4}$ h.p. MODEL.—70×64.5 mm. (248 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; C.A.V. chain-driven mag.; Burman 3-sp. gear; clutch and kick-starter; chain drive; 26×21in. tyres. Price, solo £95.

This lightweight model is an attractive light solo model, having a very similar general specification to the big twin just described. The chains are completely en-

A $2\frac{3}{4}$ h.p. J.A.P. engine-three-speed Burman gear box and final belt transmission are features of the Sirrah.

is also offered with 8 h.p. engine, 85×88=998 c.c., at the same price) is a splendidly conceived machine assembled around the Blackburne engine and Sturmev-Archer gear box. Sloping top tube frame construction has been followed and Brampton forks are used. A saddle tank is fitted, and oiling is by means of a semi-automatic drip feed. Exceptionally wide dome section mudguards are employed, and the front one encircles the

closed and the brakework is similar, there being a front hub expanding brake and one acting on a dummy belt rim at the rear. A $2\frac{3}{4}$ h.p. model, also J.A.P.-engined, costs £92; and a two-speed Blackburne model with chain and belt drive is £77.

By the same makers are also displayed the following Sirrah machines: A single-speed two-stroke with Union engine of 70×76 mm. (292 c.c.), price £38; and the same machine with two-speed, kick-starter, and clutch, at £50, or £67 with a miniature sidecar. A Blackburne-engined $2\frac{3}{4}$ h.p. Sirrah also costs £67 solo with two-speed gear; and a bigger machine with a 5-6 h.p. J.A.P. twin engine is also staged—this costs £125. The Sirrah models follow the general lines of the Verus range, but are not so

well equipped, having lighter tyres, mudguards, etc.; they are also fitted with chain guards only.

OLYMPIC AND NEW COURIER. (135.)

$2\frac{3}{4}$ h.p. MODEL.—70×70 mm. (269 c.c.); single-cyl. two-stroke; drip feed lubrication; Amac or Vici carb.; flywheel mag.; 26×24in. tyres. Prices: Solo, from £45.

OLYMPIC CYCLE AND MOTOR CO., LTD., Wolverhampton.—For 1922 this firm is concentrating on medium-powered machines, considering that more than $2\frac{3}{4}$ h.p. is unnecessary. It is impossible to give any very close specification of either the New Courier or Olympic models, for the whole point of the exhibit is a specially designed frame into which practically any engine and any gear box can be fitted without additional cost. Substantial construction is the second motive of the frame design, exemplified by the use of butted and reinforced tubes free from bends and of oversize lugs. The New Courier models are planned to be as cheap and as sound as engineering principles allow. 350 c.c. J.A.P. or Blackburne engines may be fitted at option.

$2\frac{3}{4}$ h.p. MODEL.—70×76 mm. (293 c.c.); single-cyl. four-stroke; side valves; drip feed lubrication; Amac or Vici carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain drive; 26×24in. tyres. Price, solo £70.

The Olympic models are intended as machines *de luxe*. On the latter range the most interesting feature is the registered swinging bracket from which the gear box is suspended. This is worth the closest study. The chain cannot get out of line. Any variety of gear box can be mounted to the requisite chain line for any make of engine. The driving chains can be adjusted very quickly and with extreme accuracy. Moreover, since the range of about three links is provided in the adjustment, the breaking of the chain on the road would matter but little, as the rider could easily remove the broken links provided there was sufficient adjustment available in the final drive. In addition, this model may be fitted with either Villiers or Blackburne engine.

WATSONIAN SIDECARS. (40.)

WATSONIAN SIDECAR Co., 129, Conybeare Street, Birmingham.—Features of this stand are the sidecars intended for business people. One of these is a commercial box carrier on a triangular chassis, which will carry loads up to 3 cwt., while the truck sidecar with a float pattern body should be highly suitable for farmers, builders, carpenters, plumbers, and persons occupied in such-like trades. Since it is constructed of

Coil front and C rear springing make the Watsonian Monarch most comfortable; there is large locker space at the back.

Footboards, silencer and magneto cover on the 5-6 h.p. Verus are of aluminium.

The Olympia Show—

oak, this body will carry two standard milk churns, small live stock, or any heavy and awkward loads. Among the touring sidecars may be mentioned a streamline polished aluminium body mounted on a light triangular chassis, and weighing 60 lb., known as the Model A, and the sporting model (R34 type), built on airship lines. The Monarch is a touring sidecar of ample dimensions, with large locker space, giving plenty of comfort while being light in weight.

Another attractive feature of this stand is the Watsonian sidecar-taxi, mounted on a chassis composed of double D section reinforced weldless steel tubes, and having a ground clearance of 8½ in. It is fitted to an Excelsior motor bicycle at five points, and is fitted with a 5 in. domed mudguard attached to the wheel frame. The body is of the landaulet type, so constructed that the top half of the upper screen opens. Triplex safety glass is used. The seat accommodates two adults, and adjustment of the hood, windows, and door light can be operated from inside. The spare wheel is carried in a locker at the rear, and behind it there is a spacious luggage platform.

Chain case of the Rudge broken away to show the new design of plate clutch.

RUDGE. (120.)

3½ h.p. MODEL.—85×88 mm. (499 c.c.); single-cyl. four-stroke; overhead inlet valve; foot pump lubrication; Senspray carb.; gear-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive, 650×65 mm. tyres. Prices: Solo £100, with sidecar £120.

RUDGE-WHITWORTH, LTD., Coventry.—Very little change has been made in the well-known Rudge models. A new stand (of course, of the spring-up type) is fitted, and with large diameter engine-shaft clutch, three-speed gear, and chain drive, the 3½ h.p. Rudge is a thoroughly prac-

One of the few 4 h.p. twins at the Show—a Calthorpe model of pleasing appearance.

Spare wheel and luggage grid are now both mounted on the body of the 7.9 h.p. Rudge sidecar.

tical double-purpose machine. At a slight extra charge, interchangeable wheels may be fitted. In spite of the attractions of this latest model single-cylinder, the sporting rider is bound to have a penchant for the famous 1914 T.T. winner with belt drive and multi gear. A roadster model on the same lines, but with pedal starter, is also listed, both at the very moderate price of £85.

7.9 h.p. MODEL.—85×88 mm. (998 c.c.); twin-cyl. four-stroke; overhead inlet valves; foot pump lubrication; Senspray carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 700×80 mm. tyres. Prices: Solo £120, with sidecar £150.

The 7.9 h.p. Rudge twin is similar to the chain-driven single, except for the engine, which follows the same lines, but has two cylinders, each of the same capacity (total, 998 c.c.). It is a fine example of the British big twin. For interchangeable wheels, £1 extra is charged.

Both light and touring sidecars are shown, and Messrs. Rudge-Whitworth, Ltd., have for some time past specialised in attachments to suit their own make of motor cycle, with admirable results.

CALTHORPE. (90.)

4 h.p. MODEL.—64 5×76 mm. (496 c.c.); twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2¼ in. tyres.

CALTHORPE MOTOR CYCLES, Barn Street, Birmingham.—Of the

two types of Calthorpe motor cycles exhibited by this firm, the chief interest is centred upon the new 4 h.p. V twin model. In weight and size this machine is very little larger than the two-stroke models, and probably it is the smallest V twin-engined mount in the Show. It is fitted with an oil-controlled spring seat-pillar, and is eminently suitable for those who require a solo mount but have occasional use for a sidecar. The sidecar is particularly neat in its body design, and the chassis is of simple construction, having rear extensions from the main tubular members which support two cantilever springs.

3 h.p. MODEL.—75×79 mm. (350 c.c.); single-cyl. two-stroke; drip feed lubrication; Amac carb.; chain-driven mag.; Burman 3-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2¼ in. tyres. Price, with sidecar £89 15s.

It is not without interest that the Calthorpe 350 c.c. engine was one of the pioneers of this now popular size. Very few alterations have been made in this model for 1922, the details of which are

Eccentric adjustment of the Rudge gear box, showing bearer bracket broken away.

very much on the lines of the model previously described.

A solo model of this machine with plain two-speed mount is priced at £60, or with clutch and kick-starter £65; another solo model is fitted with a 2½ h.p. J.A.P. engine, and is offered at £65 and £70, with plain two-speed and two-speed, clutch, and kick-starter respectively. A 2½ h.p. two-stroke with direct belt drive is also listed.

The Olympia Show—

HARLEY-DAVIDSON. (35.)

7.9 H.P. MODEL.—84.1×88.9 mm. (998 c.c.); V twin-cyl. four-stroke; overhead inlet valves; mechanical lubrication; Schebler carb.; gear-driven mag.; 5-sp. gear; clutch and kick-starter; chain drive; 26×31a. tyres.

HARLEY-DAVIDSON MOTOR CO., LTD., Newman Street, W.I.—The Harley-Davidson, which has been improved in minor details for 1922, has attained much popularity in this country during its comparatively short sojourn. Opinion appears to differ regarding the new colour—a very dark olive green; but from the purely aesthetic point of view, it is perhaps an improvement on the more utilitarian khaki. Engine, gear box, and transmission are unaltered; but several years' experience of an "electrified" model has suggested a more complete weatherproofing of the combined lighting and ignition distributor, the terminals now being underneath. On this model the head lamp and horn are supported on the one bracket. Acetylene lamps and a mechanical horn are supplied with

Although primarily a sidecar machine, the magneto model 7.9 h.p. Harley-Davidson is often used solo. It is sold fully equipped with lamps, etc.

Modelled on the lines of a costly limousine car this elaborate sidecar is exhibited attached to a 7.9 h.p. Harley-Davidson.

the magneto type, and Bonniksen speedometers with a rear wheel drive are standard on all models. Twist grip control, an inter-connected hand and foot clutch lever, and a massive steering head and loop frame are typically American features worth noting. Mudguarding, too, appears to be most efficiently carried out. An imposing sidecar of the miniature limousine type, attached to an electrically-equipped model, attracts much attention from potential sidecar passengers.

4 H.P. MODEL.—70×76 mm. (584 c.c.); flat twin-cyl. four-stroke; side-by-side valves; mechanical lubrication; Schebler carb.; gear-driven mag.; 5-sp. gear; clutch and kick-starter; gear and chain drive; 700×80 tyres.

Intended as a solo machine, the flat twin sports model should appeal to those to whom weight is a secondary consideration to reasonable comfort and smooth running. Nevertheless, although 700×80 mm. tyres are fitted, and the equipment—electric or acetylene lighting—is very complete, it is not an unduly heavy machine; the centre of gravity of the power unit is also extremely low. At the same time it possesses the requisite power for sidecar haulage, and a special attachment is provided.

P. AND M. (57.)

4½ H.P. MODEL.—84.5×100 mm. (555 c.c.); single-cyl. four-stroke; side-by-side valves; mechanical lubrication; B. and B. carb.; chain-driven mag.; 4-sp. gear; clutch and kick-starter; all-chain drive; 26×2½ in. tyres. Prices: A Model, solo £120 10s., with sidecar £149 10s.

PHELON AND MOORE, LTD., 4, Berners Street, W.I.—P. and M. motor bicycles are this year sold in two types, of which the Type A is sold complete and

ready for the road. It is an extremely handsome machine, fitted with a cast aluminium front chain case and sheet metal rear chain case, both chains being entirely enclosed. The chief features for 1922 are a larger engine, increased cooling surfaces by increasing the size of the fins (now at right angles to the bore of the inclined cylinder instead of parallel with the ground as in last year's model), an improved timing gear, and a ratchet brake, so as to hold the machine when at rest on a hill—a very commendable point when a sidecar is used, and one that may well be imitated by other designers.

The finish of these machines is excellent. This model without lamps weighs 282 lb., but, fitted with a lighter sidecar, a saving of 20 lb. is effected on last year's model, and this notwithstanding a larger engine and a four-speed gear box. *Appropos* of the gear box, it must be pointed out that the change to the higher ratios is effected by means of dog clutches, but the friction clutches incorporated in the expanding P. and M. gear are operative on all speeds. The machine is luxuriously equipped in every detail, and is provided with a Brooks B 600 cantilever saddle.

So far as details are concerned, the B. Type (sold at £102, solo) is identical with the types described, except that it is supplied without accessories and that a Brooks 170 saddle is fitted. There is no ratchet side brake, only one toolbag, and chain guards instead of chain cases are provided. The weight of this machine is 264 lb.

Many years' experience is behind the latest 4½ h.p. P. and M., now fitted with a four-speed gear.

The Olympia Show—

Part sectional view of the new P. and M. four-speed gear and kick-starter, showing how the additional two speeds are obtained.

For the first time in their history, Phelon and Moore, Ltd., have made their own sidecar chassis. It is of simple design and attached to the machine at four points. The C springs are anchored to the duplex axle tube beneath the axle proper, while the fore part of the sidecar is attached to leaf springs under the parallel side members. The front cross member is curved so as to allow for movement of the body. To prevent rattle, a

loose sleeve or floating washer is fitted to the forked sidecar couplings, the washer being always kept up against the spigot portion of the coupling, provided the nut is kept tight. It is worth recording that both types of P. and M. machines can be fitted with 3in. tyres, and, to conform with Continental conditions, the sidecar may be fitted to either side of the motor bicycle.

For the convenience of the front passenger the door of the Matchless tandem-seated sidecar ingeniously opens at each side. The combined catch and hinge is shown.

MATCHLESS. (65.)

7 H.P. MODEL.—85.5×85 mm. (996 c.c.); V twin-cyl. four-stroke; side-by-side valves; hand pump lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; all-chain drive; 26×3in. tyres. Price: Sports model, Type J, solo, £130.

H. COLLIER AND SONS, LTD., Plumstead Road, Woolwich, S.E.18.—Having given up the manufacture of solo machines since the war, Collier and Sons have now re-entered this market with their 7 h.p. sports model, which should strongly appeal to the rider who leans to the fast and powerful mount.

Either the J.A.P. engine as specified above or the M.A.G. (82×94 mm.) may be fitted. In this model the frame is rigid, and, while the front chain is enclosed, the rear is protected by means of a guard. In

Components of the Matchless front hub.

Originally intended as a fast solo mount the rigid-frame 8 h.p. Matchless is also marketed with a low rakish sidecar.

this machine the clutch is hand-controlled, and the handle-bars are wide. Footrests instead of footboards are fitted. Naturally, special attention is paid to the tuning of the engine, while the gear ratios are 4.1, 7½, and 10½ to 1. Stands are fitted to both wheels, and such a well-appreciated feature in former Matchless models as the combined kick-starter and exhaust lifter is retained. The machine is also a capital double-purpose mount of the go-anywhere type.

7 H.P. MODEL.—82×94 mm. (998 c.c.); V twin-cyl. four-stroke; overhead inlet valves; hand pump lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×3in. tyres.

No mechanical alterations have been

made in the spring frame model Matchless, but a new bearer arm for the sidecar body allows the seat to assume a lower position, and the battery box is now so arranged that it may be carried below the level of the floorboards. Mention has already been made of the sports model sidecar outfit. This is fitted with a well-upholstered body, a foot-controlled clutch, and kick-up stand with self-fastening clip, the sidecar stand forming part of the wheel frame, while there is a large tool box on the top tube, held by clips inside the tool box.

So far as the spring frame model is concerned, one of the most interesting exhibits is the double-seated sidecar, equipped with screen for both passengers and a combined hinge and fastening on each side of the door; consequently either side of the door may be opened, and egress or ingress are easy for either front or back passenger. The sidecar has a collapsible front floorboard, so that when the front seat is unoccupied the floorboard may assume its normal position. Another of the Matchless exhibits is shown fitted with a box carrier.

GRINDLAY. (27.)

GRINDLAY, LTD., Spon End, Coventry.—The fact that practically no alteration has been made in the chassis construction of the well-known Grindlay range of sidecars is a tribute to its design. Newcomers to the pastime should examine the system of springing the wheel in addition to the body suspension. This considerably reduces road shocks before the body springs are called upon for service.

Grindlay sidecars are exhibited in many different styles, ranging from a

Handsome lines combine with efficient suspension in the Grindlay Club model sidecar.

The Olympia Show—

lightweight model which costs £17 to the full touring type priced at £38. Of these, a blue sporting model and a larger type—finished in black with an aluminium “deck”—named the club model, at once attract the eye of the fast sidecarist. The latter model especially has a strong appeal to owners of powerful machines, for its large size and handsome appearance make it suitable for the largest motor cycles, but it looks just as well

On one of the Grindlay sidecars a face screen is provided, adjustable as to position by the supporting arm shown.

on the mediumweight 4½ h.p. Humber to which it is fitted.

The touring types, too, are attractive, and have deeply padded spring backs and plenty of locker room.

NEW HUDSON. (38.)

10 H.P. MODEL.—82×94 mm. (996 c.c.); V twin-cyl. four-stroke; overhead inlet valves; drip feed lubrication; Cox & Atwood carb.; Lucas gear-driven Magdyno; 3-sp. and reverse gear; clutchshaft and final chain drive; 700×80 mm. heavy tyres. Price £230.

NEW HUDSON, LTD., Icknield Street, Birmingham.—Those who consider that the three-wheeler has great possibilities will view this exhibit with satisfaction, for the New Hudson runabout represents clean design, reasonable simplicity, and is yet as elaborate as this type of vehicle is ever likely to be with success. Neither motor cycle nor car practice has been followed blindly, and, although the design takes a little from both, it is, first and last, a three-wheeler. Transmission is by shaft from the water-cooled M.A.G. engine to the car-type gear box, and then by chain to the rear wheel. All three wheels are quickly detachable

After an absence of many years, a New Hudson 4½ h.p. sidecar outfit is exhibited at the Show.

The last word in three-wheelers, the New Hudson re-appears at Olympia with a M.A.G. engine.

and interchangeable, and a permanent jack is incorporated in the rear frame. Steering is by rack and pinion, and the front suspension is on quarter-ellip-

4½ H.P. MODEL.—87×100 mm. (594 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; Sturmey-Archer 3-sp. gear; clutch and kick-starter; chain drive; 700×80 mm. tyres. Prices: Solo £100, with sidecar £125.

The revival of the name of New Hudson on the tank of a sidecar outfit is of considerable interest, and this new single-cylinder model is well worthy of examination by those who cast doubts on

Leaf springing for both front and rear of the 3 h.p. Royal Ruby makes it a luxurious medium powered mount. The new Royal Ruby engine is of 375 c.c. capacity.

tic springs. The bodywork is very handsome, and the seating accommodation roomy and comfortable. Electric lighting by Lucas Magdyno is standard. Priced at £250, a finely streamlined sporting model with an aluminium body at least holds its own with anything in the building on the score of attractive appearance.

the actual progress made since pre-war days. There is nothing unconventional about the machine or its power unit. A single cam operates both valves, plain bearings are used throughout, the valve ports are arranged for efficient cooling, and the magneto is carried behind the engine. These are perhaps the most noteworthy points of an exceedingly straightforward plant. A modified control, consisting of a gate in the tank, has been adapted to a standard Sturmey-Archer gear box, and a transmission shock absorber is carried on the engine-shaft. Leg shields and footboards are standard, and, although the machine does not look high, the ground clearance is actually 6in. The tyre size (see above) is particularly noteworthy.

2½ H.P. MODEL.—62×70 mm. (211 c.c.); single-cyl. two-stroke; drip feed lubrication; B. and B. carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; all-chain drive; 24×2½ in. tyres. Price, solo £63.

Little alteration has been made to the New Hudson two-stroke. In addition to the model specified above, there is a chain-cum-belt machine at £60, and an all-chain racing model with “semi-discs” at £70. The general proportions of this model are in keeping with the 24in. wheels.

The Olympia Show—

A similar side-car model with a 5-6 h.p. J.A.P. engine and chain-cum-belt transmission is offered

capable of an excellent turn of speed. In this case, a two-speed gear with clutch and kick-starter is fitted, and a special heel brake, acting directly on the inside diameter of the belt rim. On the cast aluminium cover protecting the front chain an opening is cast, leaving the letter H, the initial of the makers, which opening also allows access for the adjustment of the clutch.

MORGAN. (63.)

8 h.p. MODEL.—85.5×85 mm. (986 c.c.); V twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; gear-driven mag.; 2-sp. gear; clutch and handle starter; chain drive; 700×60 mm. tyres. Price, solo £150.

THE MORGAN MOTOR CO., Malvern Link.—This is a special model Morgan sold at a moderate price, which includes complete equipment. The chassis is somewhat shorter than the standard, and a straight dash without cowl is fitted. An air-cooled J.A.P. engine is used.

An interesting portion of the exhibit is a chassis, a useful reminder that the extreme simplicity so long peculiar to one of the oldest and most successful of three-wheelers is retained.

A special model, which is built only to order, and is known as the Aero, is another attractive exhibit. The radiator is nickel plated, as is the polished tank. Aeroplane type windscreens are fitted, while a graceful domed back gives an

Of interest to those seeking a passenger outfit of low upkeep costs—the 2½ h.p. two-stroke Calthorpe two-stroke. The engine is 75×79 mm. = 350 c.c.

HAZLEWOOD. (66.)

8 h.p. MODEL.—85.5×85 mm. (986 c.c.); twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×3 in. tyres. Price, with sidecar £176.

HAZLEWOODS, LTD., West Orchard, Coventry.—Two sidecar machines, a dual-purpose mount and a lightweight, form

at £118, at which figure it is extremely good value.

On both models the gear box is of Messrs. Hazlewood's own manufacture, and bears an excellent reputation.

Although intended chiefly as a solo mount, the 4 h.p. single-cylinder model attracts the attention of those in search of a dual-purpose machine. It follows the

A special type of Morgan—the Aero model, fitted with 8 h.p. water-cooled M.A.C. engine

same general lines as the twin models, and, with chain-cum-belt transmission and 650×65 mm. tyres, is sold at £98.

2½ h.p. MODEL.—70×76 mm. (293 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2¼ in. tyres. Prices: Solo £67, with sidecar £86.

The 2½ h.p. sports model is a lightweight

Particularly suited for a lightweight is the detachable brake unit on the new 2½ h.p. Hazlewood.

the Hazlewood range. The 8 h.p. model is a chain-driven machine with internal-expanding rear brake and a front brake of the dummy belt rim type. A spring saddle pillar is a feature of this model, and a saddle tank is fitted on this size only.

An addition to the Hazlewood range, a machine with 4 h.p. J.A.P. engine and Surrmev-Archer three-speed gear

admirable finish to the whole. The particular model shown is provided with Lucas electric lighting, speedometer, and clock. It is a very handsome machine, highly suitable for fast touring, and costs £235.

Another interesting type is the "family" Morgan, which accommodates two adults in the front and two children at the rear. It is sold at £191, including a full equipment.

No fewer than nine examples of this popular three-wheeler and a chassis are shown. The *de luce* model has a spring cushion, and the instrument board is of polished aluminium, while underneath it is a tray for odds and ends.

FRANCIS-BARNETT. (28.)

2½ h.p. MODEL.—70×90 mm. (350 c.c.); single-cyl. four-stroke; side-by-side valves; hand pump lubrication; B. and B. carb.; chain-driven mag.; Surrmev-Archer 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼ in. tyres. Price, solo £85.

FRANCIS AND BARNETT, LTD., Lower Ford Street, Coventry.—Two cooks given the same ingredients would not necessarily produce equally tasty dishes. In

The Olympia Show—

the same way, two motor cycle designers evolving machines with exactly similar specifications in the more important component parts may not both succeed in producing equally attractive mounts. The sports model Francis-Barnett illustrates the point, for it displays much useful originality for a machine embodying proprietary units, and is distinctly pleasing in appearance. A saddle tank is naturally a feature, as it has been on this make for some considerable time now. Brampton forks are fitted and have a positive stop to prevent the handle-bars from fouling the tank. Another instance of nice detail design is provided by the ingenious way in which the Sturmey-Archer gear quadrant is mounted on the bottom bracket, being held down by the gear box nuts. Thus adjustment of the primary chain does not upset the gear control. Footrests, of course, are fitted to this model, and they are adjustable in five different positions. The front chain is protected by a neat aluminium cover and the rear by a light guard. Finished in black, this machine fully earns the title of "sports model," without resorting to freakishness. For an extra £5 a specially tuned speed machine will be supplied.

2½ h.p. MODEL.—70×76 mm. (293 c.c.); single-cyl. four-stroke; side-by-side valves; hand pump lubrication; B. and L. carb.; chain-driven mag.; Sturmey-Archer 2-sp. gear; clutch and kick-starter; chain and belt drive; 26×2½ in. tyres. Price, solo £73.

5.6 h.p. Raleigh spring-framed three-speed double-purpose mount.

A sporting model of the 8 h.p. Zenith-Gradua.

This well-known model of the Francis-Barnett has been little altered since last year and differs only from the sporting mount in the points enumerated above. With an M-L Maglita set, the price is £88. Finally, a simple model of two-stroke (with a Villiers engine) is shown, and, although the tank is not of the saddle type, the rest of the machine is

bars are fitted, but the sports model has footrests and special bars. A large tool bag is mounted on the seat-pillar tube.

This lightweight model is also available with a larger engine of 76×88 mm. (399 c.c.), and, so equipped, it is principally intended for sidecar use. The main specification is otherwise the same, but either model can be fitted with a three-speed Sturmey-Archer gear box for £5 extra. The price of the larger model, rated at 3 h.p., is £75, the sidecar costing £25.

ZENITH. (74.)

3½ h.p. MODEL.—68×68 mm. (498 c.c.); twin-cyl. four-stroke; inclined overhead valves; forced lubrication; Amac carb.; gear-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½ in. tyres. Price, solo £119.

ZENITH MOTORS, LTD., Hampton Court.—Described in detail in the last issue, the new chain-driven Bradshaw-engined Zenith is the cynosure of all eyes, and is, indeed, one of the most interesting

machines in the Show. The engine is, of course, oil-cooled; a pump in the sump forces oil to the bearings and over the cylinders, which are sunk into the crank case for that purpose. In addition to the unorthodox engine, chain drive through-out is another important innovation for the Zenith Co., while the new position and construction of the silencer, which is now placed forward of the engine, is also worthy of inspection.

Arrangement of the horizontally acting rear brake on the 3½ h.p. Zenith-Bradshaw.

A Sturmey gear box is fitted. Models are also shown with belt transmission and the Gradua gear on the engine-shaft, the price in this case being £113.

5 h.p. MODEL.—70×88 mm. (654 c.c.); twin-cyl. four-stroke; side-by-side valves; hand pump lubrication; Amac carb.; chain-driven mag.; Gradua gear; clutch and kick-starter; chain-cum-belt drive; 650×65 mm. tyres. Prices: Solo £118, with sidecar £147.

The attractions of belt drive with the Gradua gear are many, and the 5 h.p. model is very popular as a dual-purpose machine. The initial drive to the countershaft is by chain, and the countershaft is

mounted in front of the engine, so that a long belt drive is obtained, the sweetness of this transmission being a distinctive feature. This machine can be obtained with the 8 h.p. J.A.P. engine for £7 extra, while both models are also available without the countershaft gear at £110 and £121 respectively. The two-

The gear box mounting and method of adjustment on the Zenith-Bradshaw.

Neat footboards, primary chain case and convenient brake pedal on the Raleigh lightweight.

The Olympia Show—

latter models are particularly suitable for the sporting rider. It will thus be seen that the Zenith range could hardly be more complete, for every type of rider is catered for, from the mediumweight enthusiast to the family man, who finds it necessary to have a high-powered and commodious sidecar outfit.

SCOTT. (128.)

3½ H.P. MODEL.—73×62.5 mm. (532.5 c.c.); twin-cyl. two-stroke; mechanical lubrication; Amac carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain drive; 26×2½ in. tyres. Prices: Solo £110, with sidecar £145.

THE SCOTT MOTOR CYCLE CO., LTD., Saltaire, Yorkshire.—This year the famous Scott is made in three models, viz., standard touring, the speed model Squirrel, and the new Colonial edition with 3 in. tyres and 8 in. road clearance. The standard model has long been pre-eminent for its road-holding qualities, comfort, and silence, and has not been appreciably altered since last year, as one would expect from the number of votes it received in our "Best Solo Machine" correspondence. A number of discerning readers have been in the habit of fitting 3 in. Palmer cords to their Scotts for some years past, asserting that they thus attain the absolute maximum road comfort. The new Colonial model is thus equipped as standard, and its high engine clearance permits of negotiating very rough roads at speed. The familiar Royal purple sidecar is retained as standard on the firm's unique triangulated chassis.

3¼ H.P. MODEL.—70×62.5 mm. (491 c.c.); twin-cyl. two-stroke; mechanical lubrication; Amac carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain drive; 26×2½ in. tyres. Prices: Solo £105, with sidecar £135.

During the past year the Squirrel has done much to enhance the interest which its debut created in 1921. Though it is sold under a speed guarantee of 60 m.p.h., it has very considerably exceeded this figure at Brooklands during the past summer. It weighs under 200 lb. stripped, and owes its name to its unique agility in corner work by reason of its frame design. Although the low gear is as high as 5.4 to 1, it is perfectly feasible to fit a sidecar to this model, and two specially light examples in polished aluminium are staged; one of

Although in its main essentials the same design as was introduced in 1910, the Scott is still one of the most distinctive machines at Olympia.

the Zeppelin and one of the slipper type. 75 m.p.g. is given as the minimum fuel consumption for solo work.

COVENTRY EAGLE. (106.)

5-6 H.P. MODEL.—70×88 mm. (678 c.c.); twin-cyl. four-stroke; side-by-side valves; hand pump lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½ in. tyres. Prices: Solo £125, with sidecar £150.

COVENTRY EAGLE CYCLE AND MOTOR CO., Coventry.—Celebrated for excellence of detail and beautiful standard finish, the 5-6 h.p. is the only twin-cylinder machine listed by the firm. With its

model, with special sporting 85.5×85 mm. J.A.P. engine, aluminium piston, footrests, and a sporting specification. Both these models sell at £110.

2¾ H.P. MODEL.—70×90 mm. (349 c.c.); single-cyl. four-stroke; side-by-side valves; hand pump lubrication; Amac carb.; chain-driven mag.; 2 or 3-sp. gear; clutch and kick-starter; chain drive; 26×2½ in. tyres. Price, solo £88 10s.

Known as the utility model, this little machine is thoroughly practical, and is fully equipped with aluminium number plates, Lucas acetylene lamps, horn, and licence holder. Adjustable footrests and internal expanding brake are also specified, and a particularly long leverage is arranged for the wedge rear brake.

The same machine is obtainable in a sports type with special engine and long exhaust pipe, price £90.

A thoroughly competitive machine as regards price is the 2½ h.p. (293 c.c.) model, with two-speed gear, chain and belt drive, and not quite such a high finish; the price is £69 6s.

2¼ H.P. MODEL.—70×64.5 mm. (249 c.c.); single-cyl. four-stroke; overhead valves; hand pump lubrication; Amac carb.; chain-driven mag.; 2 or 3-sp. gear; clutch and kick-starter; chain drive; 26×2½ in. tyres. Price, solo £105.

The luxury model is again complete with all necessary road fittings and a very complete tool kit. It is intended to

Well-rounded and symmetrical, the capacious aluminium silencer of the 2½ h.p. Coventry Eagle enhances the appearance of the engine unit.

sloping top tube and rounded saddle tank finished in dull black, it presents a striking appearance, and the dark colours are relieved by heavily plated cylinder bases and fittings. As with all other models, an Eagle mascot occupies a prominent position on the handle-bar stem, the bars themselves being part of the head clip lug.

Fitted in a similar frame is a machine with the 4½ h.p. J.A.P. engine (85×95 mm.). This machine has a neat cast aluminium silencer, long footboards with rubber rests at the front, and internal V brakes on both wheels. A third and similar machine is the 3½ h.p. sports

Overhead valve gear of the 2½ h.p. Coventry Eagle. The rockers are mounted on roller bearings.

Large, quick-opening filler caps are used on the bulbous saddle tank of the 2½ h.p. Coventry Eagle.

The Olympia Show—

be an ideal for its class, and is perhaps the most highly finished machine in the Show. A distinctive finned exhaust branch is of cast aluminium, and even the silencer extension pipe is of aluminium tube. An internal expanding front brake is fitted. A careful study of this machine is well merited. Extra

Carburettor side of the 350 c.c. two-stroke Ivy, showing gate change gear.

heavy tyres are fitted to nearly all models, and every type is equipped with an oil gun behind the saddle tube:

IVY. (64.)

3 H.P. MODEL.—75×79 mm. (348 c.c.); single-cyl. two-stroke; drip feed lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; all-chain drive; 26×2½ in. tyres. Prices: Solo £77, with sidecar £103.

S. A. NEWMAN, LTD., 49, Lichfield Road, Birmingham.—The 3 h.p. Ivy is a very attractive two-stroke fitted with brakes applied to dummy belt rims on both wheels and an improved form of fork which gives vertical as well as oscillating motion. Legshields are fitted to protect the rider. Either wheel may be removed without interfering with the brakes. The filler caps are hinged directly on to the tank and are secured by means of expanding leather rings.

A sports model two-stroke—the 3 h.p. Ivy. It has chain drive, and sidecar lugs are built into the frame.

3 H.P. MODEL.—75×79 mm. (348 c.c.); single-cyl. two-stroke; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½ in. tyres. Price, solo £81.

This machine is especially intended for competition work and is fitted with a carefully tuned engine with internal as well as an external flywheel, lighter piston and connecting rod, and a flywheel with a tapered rim. Flexible oil and petrol pipes are fitted. A Moss three-speed gear box is also fitted, in which the change of gear is operated by foot, and there is a device on the handle-bar to prevent one changing down from top and over-running middle gear. This machine is a replica of the 3 h.p. machine which won the 350 c.c. class in the 500 Miles Race.

The model shown with a sidecar is practically identical with the chain-driven Ivy first described, but is fitted with a hand-controlled Moss gear. A chain-cum-belt model is also shown.

2½ H.P. MODEL.—64×70 mm. (224 c.c.); single-cyl. two-stroke; pump-cum-drip feed lubrication; Amac carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2½ in. tyres. Price, solo £62.

The Ivy ladies' machine should certainly attract motor cyclists of the fair sex, as it is a thoroughly practical mount and has been on the market since 1913. It preserves many of the features of the model previously described, including the excellent spring-up back stand. The 2½ h.p. is sold at the same price as the ladies' model; it is fitted with an identical type of engine and gear box, and only differs so far as the frame is concerned.

COULSON. (73.)

2½ H.P. MODEL.—70×70 mm. (269 c.c.); single-cyl. two-stroke; drip feed lubrication; Cox carb.; direct driven mag.; 2-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2½ in. tyres. Price, solo £67-10s.

A. W. WALL, LTD., Tyseley, Birmingham.—Amongst spring frame machines the Coulson has established a sound reputation. It is now offered with a 2½ h.p. Liberty two-stroke engine, and, with a two-speed gear and chain-cum-belt drive, it forms a notable addition to the number of lightweight machines now on the market. As with other Coulson models, it has two internal expanding brakes in the rear wheel.

2½ H.P. MODEL.—71×88 mm. (348 c.c.); single-cyl. four-stroke; side-by-side valves; hand pump lubrication; Cox carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2½ in. tyres. Price, solo £78.

As a mediumweight machine the 2½ h.p. Coulson is attractive, since few other

Stand and gear box bracket have been modified on the Coulson spring frame.

machines of the same power and specification offer to the rider the advantages of a sprung frame. The Blackburne engine adopted for the power unit is sufficiently well known to need no further comment. Undoubtedly the sporting rider is well catered for, since a similar model is offered with the new overhead valve Blackburne engine. In this case a three-speed gear is incorporated, and the drive is by chain and belt. A clutch is fitted but no kick-starter.

The Coulson range is well rounded off by the 4½ h.p. model. A Blackburne engine is employed with a three-speed gear and chain-cum-belt transmission. As on the other models, a Cox carburettor is fitted, controlled by a single lever. An unusual point is the retention of hand

(Left) Induction pipe on the Brough Superior. (Right) Method of attaching handle-bar to head clip.

pump lubrication. This machine is eminently a dual-purpose mount, and is exhibited as such. New features on Coulson models are internal expanding brakes on each side of the rear wheel and splayed aluminium footboards. The finish in black and blue has been considerably improved.

BROUGH SUPERIOR. (144.)

8 H.P. MODEL.—85.5×85 mm. (986 c.c.); V twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; M.L. chain-driven mag.; 3-sp. gear (close ratio); clutch and kick-starter; chain drive; 26×3 in. tyres. Prices: Solo £150, with sidecar £180.

G. BROUGH, Haydn Road, Nottingham.—Starting out as a super-luxurious speedman's o.h.v. big twin, the Brough Superior is now shown with the new side-by-side valve J.A.P. engine, although the o.h.v. model (at £160), with its 90×77.5 mm. engine, is also shown. In addition, there is a 5.6 h.p. M.A.G.-engined model, which is in a somewhat lighter category, although all embody the same general specification.

It is a sound policy of the designer to maintain his original idea in providing only the special highly finished and tuned mounts now associated with his name, for there is always a market for

The Olympia Show—

The tank of the Brough Superior is noticeably clean in design.

superlatively finished productions. The plated tanks, exhaust pipes and fittings, and the polished aluminium valve cap radiators and exhaust branches and silencers, make these machines into a resplendent display. In detail there are small improvements. The majority of the models are equipped with a new leaf spring front fork of the Montgomery type, which has special provision for lubricating the spindles and for elimin-

A new and smaller model of the Brough Superior, the engine in this case being a 6 h.p. twin, driving through a Sturmey-Archer three-speed gear box. Observe the new-type Montgomery spring fork.

ating side play. There is a Webb front brake, but the rear brake is of the dummy belt rim type. Lubrication is by a drip-feed pump operated from a Bowden lever on the handle-bar. On one of the machines a beautifully finished Toronda sidecar is fitted; this is of mottled aluminium, and embodies a disappearing hood.

SHEFFIELD-HENDERSON. (130.)

2½ h.p. MODEL.—71×88 mm. (348 c.c.); single-cyl. four-stroke; overhead valves; hand pump lubrication; B. and B. or Amac carb.; chain-driven mag.; 3-sp. gear; clutch, without kick-starter; chain drive; 26×2½ in. tyres. Prices: Solo £110, with sidecar £150.

HENDERSON SIDECARS, Sheffield.—The speed model Henderson is sold under a written guarantee that it has actually exceeded 70 m.p.h. on the road. The engine is the 2½ h.p. overhead valve

The neat arrangement of the tool bag on the Sheffield-Henderson sporting model.

Blackburne with special modifications. When delivered, it is fitted with a cast iron piston, but a special high-compression aluminium piston is included gratis for use in sprint events. The machine is a replica of those in preparation for the 1922 T.T. Races. It weighs no more than 185 lb., and the saddle position is particularly low. A neat featherweight prop stand, fixed to the footrest is supplied for use when the machine is stripped. A bronze racing sidecar is fitted to one of the machines exhibited.

4¼ h.p. MODEL.—85×97 mm. (548 c.c.); single-cyl. four-stroke; side valves; drip feed lubrication; Amac or B. and B. carb.; chain-driven mag.; Sturmey-Archer 3-sp. gear; clutch and kick-starter; chain drive; 26×2½ in. tyres. Prices: Solo £110, with sidecar £132 10s.

The 4½ h.p. Henderson is designed throughout as an extremely robust touring mount, a notable feature being the elimination of all small parts; nothing less than ¼ in. bolts are used. The Blackburne engine is fitted. The front of the machine

screen results in greater head room when the hood is up. A very neat addition, the M-L dynamo switchboard, is mounted just beside the control levers. Readers familiar with the car will remember that the engine is enclosed in a compartment on the off side of the chassis. The shuttering of this compartment has now been improved, so that its contents can be laid bare in a few seconds.

MILLFORD SIDECARS. (58.)

MILLS-FULFORD, LTD., Crown Works, Coventry.—One of the features of this stand is the Millford Rock chassisless sidecar, an Australian invention which made its appearance in England for the first time at the last Show. The usual two-wheeled chassis is dispensed with, and is replaced back and front by two steel members attached directly to the body; at the front the sidecar is suspended from the member attached to the down tube

Specially made for racing: the Henderson ultra-lightweight sidecar. Note that the mudguard is mounted on the body

deserves special attention, the handle-bar being trebly bolted to the forks, so that it cannot twist, whilst ¼ in. balls are used in the steering head bearings. Several types of sidecars are staged, of which the most interesting are the spring wheel model and the detachable dickey type.

SCOTT SOCIABLE. (131.)

5 h.p. MODEL.—76.2×63.5 mm. (578 c.c.); twin-cyl. two-stroke (water-cooled); petrol lubrication; Zenith-Scott carb.; gear-driven mag.; 3-sp. gear; clutch and hand starter; spiral bevel drive; 700×80 mm. tyres. Price, solo £215.

SCOTT AUTOCAR Co., Bradford.—The real aim of the Scott Sociable is to supply the public with the comfort, convenience, and performance of a car at the cost of a motor cycle and sidecar. During the last year its price has dropped from £273 to £215, and if this latest figure is slightly above the typical sidecar level, it must be remembered that the Scott Sociable embodies every conceivable fitting. It is impossible to detail all the refinements, but they include a clear-view windscreen, four interchangeable wheels, dashboard parcels rest, a capacious dickey which can be used for luggage, and many other items. The principal changes since last Show consist of a slight stiffening up of the transmission, the addition of an M-L dynamo, the substitution of a solid for a hollow propeller-shaft, and a higher windscreen. The car was always silent, but has been further quietened by the use of a spiral bevel, with which a spring drive is incorporated. The radiator has been enlarged, so that there is no fear of overheating even at sustained speed with a following wind. The raising of the

of the machine by means of an enclosed coil spring. This chassis has now stood a whole year's testing on English roads, and has given every satisfaction.

As regards other models, every sidecar is fitted on the standard Millford chassis, which has duplex members throughout; that is to say, duplex axle tubes and side members. The difference in types, therefore, lies in the style of body fitted. Naturally, in the case of the heavier machines four-point attachment is utilised, and three-point for the lighter ones. A difference is also made in the mudguards: the lighter and less expen-

Front aspect of the new Scott Sociable, the guard of which has been considerably extended, and the radiator modified in design.

The Olympia Show—

Neat body lines characterise this new Milltord model; an aluminium step is fitted to the top side member of the duplex chassis.

One of the many examples of Canoelet sidecars in the Show. It has a luggage rail over the rear locker.

sive sidecars being fitted with ordinary domed mudguard, while the higher-priced models have a guard 6in. wide. The *de luxe* model is exceptionally well upholstered and most comfortable. Special attention is paid to the requirements of the family man, and this fact is brought to light in the design of the

Unique method of saddle suspension adopted on the 6 h.p. Douglas.

sidecar body, which will comfortably take two adults. Another body has ample room for the child's seat provided with it.

CANOELET SIDECARS. (139.)

MEAD AND DEAKIN, Tyseley, Birmingham.—In addition to the well-known Canoelet sidecar, such as the MM4, the Minor, the taxicab, and the box carrier models, there is an entirely new production on semi-sporting lines. Distinguished by the uninspiring title of the A4, this is better described as a canoe-shaped body mounted on a trident-like chassis, which is slightly underslung; the three main tubes converge to the front, where they support the two quarter-elliptic body springs. The back of the body is carried on a transverse leaf spring. The canoe

shape of this sidecar is enhanced by a small railed deck and "tumble home" stern at the back of the seat. Beneath the deck, which is hinged, is a most capacious locker. This model is priced at £25 15s. Several modifications have been made in the K4 sporting type, such as the inclusion of a shallow locker in the tail of the body, a permanent back rest to the seat, and the attachment of the mudguard to the body, a feature which is incorporated in all Canoelet models; the price is £20 5s., while the smaller lightweight sidecar, the model P, weighing but 85 lb., is shown at £18 5s.

DOUGLAS. (119.)

2½ P.H. MODEL.—60.8×60 mm. (348 c.c.); flat twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; gear-driven mag.; 2-sp. gear, without clutch and kick-starter; chain-cum-belt drive; 26×2¼in. tyres. Price, solo £75 (fully equipped).

DOUGLAS MOTORS, LTD., Kingswood, Bristol.—There are no alterations in the standard two-speed 2½ h.p. Douglas, but in the three-speed model (priced at £90) new cylinder castings are employed, ensuring better cooling. The usual three-speed clutch and kick-starter gear box unit is on exhibit, and the machine is turned out with such refinements as wide mudguards with valances and a belt guard. This model, like all other Douglas machines, is presented fully equipped.

3½ P.H. MODEL.—68×68 mm. (494 c.c.); flat twin-cyl. four-stroke; overhead valves; semi-automatic pump and sight feed lubrication; Amac carb.; gear-driven mag.; 3-sp. gear, clutch and kick-starter; all-chain drive; 650×65 mm. tyres. Price, solo £130.

It would be difficult to conceive a more attractive machine than the Douglas

sporting model. It is fitted with overhead valves with wick lubricated rockers. The kick-starter and foot brake (internally expanding Ferodo lined) are on the right-hand side, and a "friction spring" shock absorber is contained in the fly-wheel in addition to a rubber block shock absorber in the rear wheel. Knock-out spindles are employed as in the other larger models. As turned out, this machine is capable of being tuned to very high speeds.

4 P.H. MODEL.—74.5×68 mm. (595 c.c.); flat twin-cyl. four-stroke; side-by-side valves; mechanical oil pump sight feed lubrication; Douglas automatic single lever carb.; gear-driven mag.; 3-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2¼in. tyres. Prices: Solo £110, with sidecar £135.

Detachable cylinder heads are this year employed on the 4 h.p. Douglas. The rather inaccessible oil filler cap is superseded by a telescopic filler. The Douglas automatic carburetter is a specially neat job, and, as in the 3½ h.p. model, the induction pipe is jacket-heated from the exhaust. An under-shield is standard.

6 P.H. MODEL.—83×68 mm. (733 c.c.); flat twin-cyl. four-stroke; overhead valves; semi-automatic lubrication; Amac carb.; gear-driven mag.; 3-sp. gear; clutch and kick-starter; all-chain drive; 710×85 mm. tyres. Price, with sidecar £165.

This machine is practically a large edition of the 3½ h.p. sporting model. Aluminium footboards, an efficient under-shield, and laminated leaf spring saddle strike the eye as the chief points of external difference, while the cylinder heads are held down by lengthened bolts instead of the simple stud and nut method of the "3½." On last year's 3½ h.p. an ordinary fish tail end was used for silencing; this year a large aluminium silencer box is fitted. The gear box is fixed per-

Contrasts in Douglas models. (Left) The 6 h.p. overhead valve type fitted with the new Douglas saddle suspension (Right) Marketed at a popular price—the 2½ h.p. mount.

The Olympia Show—

manently, and chain adjustment is obtained by sliding the engine in its housing. The sidecar is a specially fine piece of work, coil sprung forward and supported aft by means of a single laminated leaf spring. The wheels are interchangeable, and there is a sliding dash containing a locker.

HUMBER. (124.)

4½ H.P. MODEL.—75×68 mm. (600 c.c.); flat twin-cyl. four-stroke; side-by-side valves; mechanical lubrication; Claudel-Hobson carb.; E.I.C. gear-driven mag.; Humber 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼ in. tyres. Price, sports solo £100.

HUMBER, LTD., Coventry.—In a business-like all-black finish, the 4½ h.p. Humber makes a strong appeal to both soloist and sidecarist, and in either guise the machine is quite distinctive on many counts. This is a remarkable testimony to the all-round efficiency of the engine, for with minor modifications the same power unit is used in the 70 m.p.h. sports model and the notably silent and smooth-running sidecar outfit; and, excepting price and tyre dimensions, the above specification of the former machine applies equally to the latter. Since last described in *The Motor Cycle*, the sporting mount has been improved in detail. For example, the oil compartment in the main tank has now been moved forward, allowing a new gear quadrant position, which bares the rear of the tank for knee grips. A light guard protects the top run of the rear chain, and the twin open exhaust pipes are now clipped together at the rear. A breather in the crank case ejects surplus oil on to the inside of the primary chain, and a more visible type of Best and Lloyd drip feed is fitted. To lower the saddle position, the Brooks racing saddle is clamped directly to the frame lug. Aluminium pistons, modified timing, interchangeable valve pockets, and narrower mudguards are the other features wherein the sports model differs from the £110 touring solo mount. With a handsome and commodious Grindlay sidecar, the latter machine sells at £144. Such additions as a Brooks cantilever saddle and an A.L. lighting set (which are both shown on the stand) may be obtained at an extra cost. An all-black machine, looking extremely serviceable and roadworthy, completes the exhibit. The low price of the sports model represents extremely good value in view of its power.

Among the most silent machines on the road, the 4½ h.p. Humber has also proved itself amply powerful for freck hill-climbing with a sidecar.

ARGSON INVALID TRICYCLE. (76.)

2 H.P. MODEL.—60×60 mm. (174 c.c.); single-cyl. two-stroke; petrol lubrication; Cox-Atmos carb.; flywheel mag.; 2-sp. or 3-sp. gear; gear drive.

ARGSON ENGINEERING CO., LTD., George Street, W.1.—A machine which is, un-

Method of attaching the power unit of the Argson to the axle of the machine.

fortunately, only too likely to interest many is the Argson invalid tricycle. Interest lies principally in the power unit, a single-cylinder two-stroke engine, with flywheel magneto, which drives a back axle of the chair through the medium of a two or three-

speed gear box, the latter forming part of the ordinary transmission from the hand levers. The controls are so arranged as to be perfectly convenient for an invalid who is unable to leave the chair, a compression release being fitted to the steering handle on the right-hand side of the machine in such a position that it is operated by a downward movement of the wrist. A contracting band brake of ample size is fitted to each rear wheel, and the single front wheel is carried by a spring fork attachment.

2 H.P. MODEL.—60×60 mm. (170 c.c.); single-cyl. two-stroke; petrol lubrication; Amac carb.; chain-driven mag.; chain drive; 16×2½ in. tyres. Price, solo £35.

A simple motor scooter for runabout use is also produced by this firm, the same two-stroke engine being employed and mounted at the front end of a light but strong frame. Power is transmitted to the rear wheel by chain via a countershaft, and two contracting band brakes are carried on the rear wheel hub. An ingenious type of spring fork is used. One short cantilever spring is rigidly attached to a lug at the base of the steering column and bearing on the front end on a stirrup carried over the wheel on the axle ends. The wheels are built up from two steel pressings, and combine the virtues of strength and lightness. As a small delivery vehicle, with a box of 3 cu. ft. capacity arranged over the rear wheel, the machine offers facilities for cheap transport of goods.

ROVER. (96.)

5-6 H.P. MODEL.—70×88 mm. (678 c.c.); twin-cyl. four-stroke; side-by-side valves; hand pump lubrication; Amac carb.; E.I.C. chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×3 in. tyres. Prices: Solo £120, with sidecar £155.

NEW ROVER CYCLE CO., LTD., Coventry.—Rover motor cycles are examples of good sound design, and the single and twin-cylinder models exhibited near the main entrance are magnificently finished. Various minor improvements have been effected for 1922, notably by the provision of a hand-controlled clutch for the three-speed gear. On the sidecar the mudguard is now mounted directly on the body, where it receives the full bene-

Replacing the direct belt-drive T.T. model, this three-speed, chain drive, sports model Rover should be almost as speedy, while possessing an extended range of action.

The Olympia Show—

Great leverage is provided by the clutch operating arm on the Rover gear box.

fit of the body suspension—a growing practice incidentally. Rover machines are notable for the fact that they have their gear levers projecting through the red and black finished tank, glass-topped filler caps and Terry links to the Druid forks.

Pneumatic pressure lubrication is used on the Villiers-engined Spark lightweight. This system is fitted to many two-strokes at the Show.

4 H.P. MODEL.—85×88 mm. (499 c.c.); single-cyl. four-stroke; side-by-side valves; hand pump lubrication; B. and B. carb.; E.I.C. chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½ tyres. Prices: Solo £100, with sidecar £135.

The single-cylinder Rover, now rated at 4 h.p., is available in two types, an innovation being the sports model offered with or without a sidecar attachment, which is in entire keeping with the de-

The triangular stand on the P.V. machine provides alternative positions. The longer legs are used in case of the necessity of changing a wheel.

sign. In the case of the new sporting model (£110) the change-speed lever is arranged on the right-hand side of the tank, and the oil pump on the left. A straight through exhaust pipe is used for the engine which differs only from the standard article in that a lightened piston and connecting rod are used. The guards, too, have been modified, for whereas dome guards with valances figure on the standard model, the sports mount has plain guards minus valances. An extremely attractive low-built sidecar is adopted having a neatly upswept scuttle which lifts up to permit easy entry despite the absence of a door. The back rest also folds forward to give access to a capacious compartment arranged in the tail of the body. Altogether the 3½ h.p. Rover sports sidecar outfit is an exhibit worthy of careful inspection.

P.V. (17.)

4 H.P. MODEL.—84.5×76 mm. (500 c.c.); V twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; chain-driven mag.; Burman 3-sp. gear; clutch and kick-starter; chain and belt drive; 26×2½ in. tyres.

P.V. MOTOR CYCLES, LTD., Forest Hill, S.E.23.—Although new spring frames of any merit are admittedly rare, one is apt, when lamenting the conservatism of

Instead of a V section drum, the Rover front brake operates on a flat rim.

it is simple. Forward extensions of the forks upon which the rear wheel pivots terminate in a lug in the correctly arched saddle tube which encloses shock and rebound coil springs. The model specified above is offered as a sports mount, and has a 500 c.c. J.A.P. engine, with the now familiar conical radiating valve caps, but the equipment is by no means that of a stripped racing machine. H.H. accumulator lighting is standard.

A 350 c.c. J.A.P.-engined model is similarly equipped, excepting that it has a B. and B. carburettor and footrests instead of footboards. Also shown are a lady's spring frame lightweight and a plain two-speed lightweight, both with Villiers engines.

The Jackstand fitted to all the P.V.'s also makes a special appeal to the lady motor cyclist. This ingenious device is simply a triangular "two-step" stand, which acts as a prop in the first position, and holds the wheel well clear of the ground for tyre repair in the second. A minimum of exertion is required to operate it.

SPARKBROOK. (93.)

2½ H.P. MODEL.—70×70 mm. (269 c.c.); single-cyl. two-stroke; no valves; drip feed lubrication; B. and B. carb.; flywheel mag.; belt drive; 26×2½ in. tyres. Price, solo £39 18s.

SPARKBROOK MFG. CO., LTD., Sparkbrook Works, Coventry. — As a new light model, the Villiers-engined Sparkbrook attracts attention, not only by reason of its specification, but also on account of the attractive price. A simple looped frame is employed, and the cylindrical pressed steel tank is held by the head lug and seat-pillar lug, which are deeply flanged. Lubrication is by drip-feed, and oil is forced through the feed

Excepting that the wheelbase is perhaps longer than the average, the spring frame 4 h.p. P.V. is commendably neat. Note the triangular Jackstand.

The Olympia Show—

by air pressure in the oil tank. Both brakes are heel-operated by a pedal on each footrest, and the shoes take effect

With 4 h.p. J.A.P. engine and three-speed Sturmey-Archer gear, the Victoria should serve well as a double-purpose mount.

inside the V of the belt rim. A novel double silencer is worthy of notice, and the all-black finish with green tank is both workmanlike and attractive. This model can also be obtained with the Villiers engine-shaft clutch.

The standard Sparkbrook two-stroke is retained, and may be had with the Sparkbrook two-speed gear box, with or without clutch, or with the Sturmey-Archer two-speed box, clutch, and kick-starter.

On very similar lines is another model with a 350 c.c. J.A.P. engine. A Sturmey-Archer three-speed lightweight gear with clutch and kick-starter, and chain-cum-belt drive. The frame is slightly different, as the top tube slopes towards the saddle. Its novel point is the fitting of spring footrests. A front wheel stand, also fitted to this model, the price of which is £84.

VICTORIA. (123.)

4 H.P. MODEL.—35×95 mm. (550 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; Sturmey-Archer 3-sp. gear; clutch and kick-starter; chain and belt drive; 26×2½ in. tyres. Price, with sidecar £100.

VICTORIA CYCLE Co., Glasgow.—Although English proprietary units mainly go to make up the various Victoria models, the machines on this stand are actually the only complete motor cycle representatives from Scotland. Nothing startling has been attempted, and the dual-purpose model specified above is typical of the whole range. It is sturdily and sensibly designed for economical motoring, solo or with sidecar, and the chief improvements on last year's equivalent model consist of modifications in the various proprietary units used. The sidecar attached (it is not shown solo) is well-sprung and roomy. The engine is a J.A.P., as the cylinder dimensions may indicate.

2½ H.P. MODEL.—70×90 mm. (350 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; Albion 3-sp. gear; clutch and kick-starter; chain and belt drive; 26×2½ in. tyres.

Lighter all round than the preceding model, this J.A.P.-engined lightweight sidecar outfit nevertheless resembles it closely. As the machine itself weighs less than 200 lb., the tax payable is only 50s.

Five other models, one each with 2½ h.p. J.A.P. and Blackburne engines and three with 2½ h.p. Villiers, are also staged.

E18

HACK. (117.)

1½ H.P. MODEL.—52×52 mm. (110 c.c.); single-cyl. two-stroke; petrol lubrication; Amac carb. gear-driven mag.; single speed gear; clutch; chain drive; 20×1½ in. tyres. Price, solo £42.

HACK ENGINEERING Co., 44, Victoria Road, Hendon.—Two examples of this very light and simple miniature are on view. Engined with the Simplex two-stroke with a primary gear reduction, this little machine is perhaps the lightest in the Show. An open frame provides ample room for a long coat or lady's dress, and a new silencer, having two expansion chambers, is used to reduce exhaust noises. A clutch is fitted to enable the machine to be wheeled easily. The petrol tank is fixed below the carrier, and a light prop stand is supplied. In front of the engine is a light dressguard, and long aluminium foot plates are provided. Both brakes are of the cycle type acting on the wheel rims.

This illustration shows the rear portion of the Hack. The 1½ h.p. two-stroke engine is mounted low down as shown, the petrol tank being suspended from the carrier.

METRO-TYLER. (142.)

2½ H.P. MODEL.—70×70 mm. (269 c.c.); single-cyl. two-stroke; drip feed lubrication; Amac carb.; B.T.H. chain-driven mag.; Albion 2-sp. gear; clutch and kick-starter; chain and belt drive; 26×2½ in. tyres. Prices: Solo £55, with sidecar £69.

METRO-TYLER Co., Ltd., Banister Road, Kilburn, W.10.—The model specified above is of the sports type, and, although engined by the two-stroke M.T., is equipped with a proprietary two-speed gear box; for an extra £5 a three-speed box may be substituted. Excellent detail work is a feature of these machines, and all nuts are either

tool box with spring lid, common to all the machines of this make, is fitted.

5-6 H.P. MODEL.—71×88 mm. (698 c.c.); V twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; B.T.H. chain-driven mag.; Burman 3-sp. gear; clutch and kick-starter; chain drive; 26×2½ in. tyres. Price, solo £125.

Built as a powerful and speedy solo model, this Blackburne-engined machine bearing the Metro-Tyler name has a most compact and handy appearance, the wheelbase being kept short by mounting the magneto behind the engine. A quick

In sharp contrast to the usual Metro-Tyler models— a 5-6 h.p. machine, suitable for solo or sidecar work.

The Olympia Show—

On the Metro-Tyler "all-enclosed" model the contact breaker is adjusted from an inspection aperture on the side of the transmission case.

detachable back wheel is fitted, the hub being dogged to the combined sprocket and brake drum. A practical item is that the rear mudguard stay is arranged to swing out of the way when the wheel is being removed.

BRADBURY. (88.)

2½ H.P. MODEL.—74.5×80 mm. (350 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2½ in. tyres. Price, solo £80.

BRADBURY AND CO., LTD., Wellington Works, Oldham.—As the Bradbury name is now carried by a 2½ h.p. lightweight, a big single of 554 c.c., a 750 c.c. twin, and the new 996 c.c. twin, the range of models is very complete, and provides for the taste of all riders. The 2½ h.p. model is available either with direct drive, two-speed gear and clutch, or with two-speed gear, clutch, and kick-starter. A point of interest is the employment of double tubes for the front down member of the frame, while the engine crank case is formed integrally with the frame. The cylinder has a detachable head, and is held down to two long bolts.

4 H.P. MODEL.—89×89 mm. (554 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 650×65 mm. tyres. Price, solo £92.

The big single is on very much the same lines as the lightweight model, the Bradbury feature of a crank case formed

integrally with the frame, of course, appearing. Transmission is by chain throughout, and an internal expanding brake is incorporated in a drum formed with the rear wheel chain sprocket. Large domed mudguards are a good feature, and the unusual frame construction renders the machine extraordinarily robust.

6 H.P. MODEL.—74.5×86 mm. (750 c.c.); twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×3 in. tyres. Price, solo £117.

Very similar are the two twin models, but in this case the engine crank case does not form a part of the frame. Detachable cylinder heads are fitted, and ribbed aluminium plugs are carried in the exhaust valve caps in order to aid cooling. Deep fins are a characteristic of all the Bradbury engines, and on the twin models the valve ports are noticeable in that vertical fins are employed.

Chain transmission through a heavy three-speed gear box is fitted, and the rear brake is internal expanding in a large drum in the rear wheel chain sprocket. The front brake also is of the internal expanding type. The dimensions of the 8 h.p. engine are 80×99 mm. bore and stroke (996 c.c.), and the price of the larger model is £135 without sidecar.

Air-cooled valve cap on the 8 h.p. Bradbury.

DIAMOND. (56.)

2½ H.P. MODEL.—70×70 mm. (269 c.c.); single-cyl. two-stroke; drip feed lubrication; Amac carb.; flywheel mag.; belt drive; 26×2¼ in. tyres. Price, solo £42 2s.

D.F.M. MFG. CO., LTD., Vane Street, Wolverhampton.—A simple single-cylinder model very moderate in price is the 2½ h.p. Diamond. The frame is the Diamond pattern, with duplex down tube and detachable lower tank rail. Steel stampings are used wherever possible. The rear mudguard is 5½ in. across. The same pattern frame is used on all Diamond models.

A similar model sold at £56 14s. has cast aluminium footboards, a Sturmey-Archer two-speed gear box with clutch and kick-starter, and chain-cum-belt drive. A well-known Diamond feature, the heel-operated back brake applied directly to the belt rim, has been retained. No loose clips are to be found on any of the Diamond machines.

2½ H.P. MODEL.—70×76 mm. (295 c.c.); single-cyl. four-stroke; side-by-side valves; pump and drip feed lubrication; Amac carb.; chain-driven mag.; 2-sp. selective clutch gear; chain-cum-belt drive; 26×2¼ in. tyres. Price, solo £57 17s.

This model somewhat resembles the previous machines except so far as the engine and gears are concerned. The

A direct operated brake having a parallel action on the Diamond.

chain case is of cast aluminium, and entirely encloses both front chains, being mudproof and oiltight. If the top half of the chain case is removed the chains may be inspected and the gears adjusted, and this is done by the removal of two pins.

A similar machine, identical with that just described except for the fitting of a Sturmey-Archer two-speed gear with clutch and kick-starter, is sold at £60 18s. On this model footrests are fitted. A three-speed gear can be fitted at a slight extra charge.

2¼ H.P. MODEL.—64.5×76 mm. (250 c.c.); single-cyl. four-stroke; 2-sp. gear; clutch and kick-starter; all-chain drive; 26×2¼ in. tyres. Price, solo £78 15s.

This machine is fitted with the T.T. type J.A.P. engine, has entirely enclosed chains, and is a really well designed and useful sporting lightweight, to which a three-speed gear box can be fitted at an extra cost of four guineas. As a sporting machine this model has no carrier proper, but a special arrangement is fitted for carrying the toolbags and supporting the rear mudguard.

2¾ H.P. MODEL.—70×90 mm. (350 c.c.); single-cyl. four-stroke; side-by-side valves; pump-cum-drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; all-chain drive; 26×2¼ in. tyres. Price, solo £84.

Known as the "Super Standard," this 2¾ h.p. solo mount, weighing approximately 196 lb., is intended for serious touring, being fitted with aluminium footboards and entirely enclosed chains.

MARTINSYDE. (47.)

3½ H.P. MODEL.—60×88 mm. (496 c.c.); twin-cyl. four-stroke; overhead exhaust valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; all-chain drive; 650×65 mm. tyres. Price, solo £110.

MARTINSYDE, LTD., Maybury Hill, Woking.—This is a sports model which should become very popular during the coming season. It is fitted with an exceptionally cool running engine, wide handle-bars, footrests, and efficient silencing

Power unit and two-speed gear of the 2½ h.p. Bradbury.

A new 8 h.p. Bradbury three-speed machine makes its first appearance at Olympia.

The Olympia Show—

The power-unit of the 6 h.p. Martinsyde. On this engine the exhaust valves are directly over the inlet valves—an unusual arrangement. The rounded tank has twin compartments, reducing the possibility of the rider inadvertently running out of petrol.

ing arrangements. It is similar to the larger type on which H. H. Bowen recently gained the fifty miles and one hour records. Foot brakes are applied to dummy belt rims. Since this model was first brought out a kick-starter has been incorporated, and the wheelbase has been slightly shortened.

6 h.p. MODEL.—70×88 mm. (678 c.c.); twin-cyl. four-stroke; overhead exhaust valves; pump-cum-drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; all-chain drive; 26×31 in. tyres. Prices: Solo £120, with sidecar £160.

This is very similar to the smaller model just described. It has more efficient mudguards and a saddle tank. The gear box is fitted with an eccentric form of adjustment. Two pairs of footrests are fitted. The sidecar has particularly attractive lines, being of the streamline pattern fitted with a small aeroplane windscreen and a sporting type hood.

A *de luxe* model is also shown fitted with Lucas Magdyno, a luxuriously fitted sidecar, with hood and screen, with spare wheel carried at the rear. It has a

With this suitable sidecar, the well mudguarded two-stroke Allon makes an excellent lightweight outfit.

Sound bodywork and a strong and simple chassis distinguish the Whitley touring model.

longer frame than the model described, a wide front mudguard with valances and a flap, an aluminium cover for the Magdyno, large footboards, and more efficient silencing arrangements, a large expansion chamber being fitted to the rear of the exhaust pipe.

WHITLEY SIDECARS. (84.)

WHITLEY MANUFACTURING Co., Ltd., Coventry.—Of the Whitley range of sidecars, perhaps the most interesting exhibit is the new Girdex chassis. This is built up of pressed steel members, and, while light in weight, it should be extremely strong and rigid. Two pressed steel girders are arranged to form a cross, and a pressed steel front member unites two of the extremities of this cross. The rear extremities of the main cruciformed member are united by a tubular cross member, which carries the stub axle and the wheel. The coachbuilt body is of pleasing shape, and is suspended by C springs at the front and by quarter-elliptic springs at the rear. The mudguard is rigidly attached to the body. This model undoubtedly presents an innovation in sidecar design. Three other models are displayed, these being the standard productions of the company, with tubular frames, in which castings are replaced by stampings, and high carbon steel tubing is

employed. The prices are £25 for the sports model, £29 10s. and £32 10s. for the touring models.

ALLON. (102.)

2 1/2 h.p. MODEL.—70×76 mm. (292 c.c.); single-cyl. two-stroke; drip feed lubrication; B. and B. carb.; flywheel mag.; 2-sp. gear; clutch and kick-starter; chain and belt drive; 26×2 1/2 in. tyres. Prices: Solo £80, with sidecar £85.

ALLDAYS AND O'NEILL, LTD., Matchless Works, Birmingham.—A very serviceable touring two-stroke with a big reputation

New piston and balanced crankshaft on the Allon two-stroke engine. Observe the ports in the side of piston.

to back it is the Allon. Several important modifications have taken place for 1922. Amongst these must be mentioned a general increase in bearing sizes, a modified piston and cylinder head, and improved oil pipe layout. The conventional magneto has given place to a Villiers fly-wheel unit, and greatly improved mudguarding is now fitted. Legshields have for long been a standard fitting, and these are, of course, retained. One of the outstanding Allon features is that the cylinder and top half of the crank case are cast in one piece, the lower half of the crank case being detachable. This permits the whole of the working parts to be removed without taking the engine out of the frame. A saddle tank, and contracting band brakes on both wheels, are still fitted.

Equipped with a three-speed Sturmey-Archer gear box and Senspray carburetter, this little machine is shown attached to a useful lightweight sidecar, which it is fully capable of propelling over reasonable country. A new silencer is fitted, and is placed behind the gear box.

6. An all-chain-driven three-speed Diamond-Jap.

8. A 2½ h.p. Olympic with chain and belt transmission.

The Olympia Show—

A sporting $2\frac{3}{4}$ h.p. mount has been added to the Massey-Arran range, the engine adopted being an overhead valve Blackburne.

COTTON. (20.)

$2\frac{3}{4}$ H.P. MODEL.—71×88 mm. (348 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; B.T.H. chain-driven mag.; Stumpey 2-sp. gear; clutch and kick-starter; chain and belt drive; 26×2 $\frac{1}{4}$ in. tyres. Price, solo £68 2s.

COTTON MOTOR CO., Gloucester.—Too often the unconventional machine tends also to look freakish and ungainly; particularly is this so when a new design of frame is attempted. The Cotton is an exception, and, although in this case the

Internal expanding brake on the rear wheel of the Massey-Arran.

design has been in existence since pre-war days, none may accuse its triangulated frame construction of jarring with accepted standards of appearance. Indeed, it is singularly neat; and it has demonstrated in recent reliability trials that, in addition to its theoretical advantages, it gives the machine wonderful road-holding and non-skidding properties. Besides being unusually low, the saddle position is appreciably further forward than usual, thus balancing the main weight well between the wheel centres. The Blackburne-engined machine specified above is a new model only in its power unit, as it has not been found necessary to alter

the original frame layout since its inception. A two-stroke (Villiers) type is similar in essential details. Improvements for next year have been made to the primary chain case (now aluminium), to the tank (a separate welded oil compartment), and to the attachment of the tank to the frame.

Both the Cotton models are finished in a nice shade of maroon, which, on account of the straightforward frame lines, should easily be kept in its pristine brightness by the average owner. Three-speed models may be obtained at an extra cost.

MASSEY-ARRAN. (134.)

$2\frac{3}{4}$ H.P. MODEL.—71×88 mm. (348 c.c.); single-cyl. four-stroke; inclined overhead valves; mechanical pump lubrication; Cox-Atmos carb.; M.L. chain-driven mag.; Burman 3-sp. gear; clutch; chain drive; 26×2 $\frac{1}{4}$ in. tyres. Price, solo £99 15s.

MASSEY-ARRAN MOTOR CO., LTD., 52, Bordesley Street, Birmingham.—Chief in the Massey-Arran products is a replica of the machine on which J. Whalley made such a fine showing in the Junior T.T. race. It has the overhead valve $2\frac{3}{4}$ h.p. Blackburne, and is fitted with all-chain drive. The saddle position is low; and the total weight has been kept well down, the figure being given as 170 lb. The drip feed lubrication has been supplemented by a Showell mechanical pump, driven from the magneto sprocket, thus doing away with the necessity for releasing the bars at speed to operate a hand pump.

There are internal expanding brakes to both wheels, and the long exhaust pipe terminates in a small aluminium expansion chamber, having internal baffles which free the owner from any anxiety as to the legality of his silencing system.

Exceptionally large bearings, lubricated by grease cups, are fitted to the Massey-Arran steering head.

machines, and the provision for lubricating the steering head is an instance. This model costs £83 10s., and a 350 c.c. J.A.P. engine may be had for the same price. There is also a two-speed model at £72 10s., and here again the choice of J.A.P. or Blackburne engines is allowed.

Although in Massey-Arran machines great use is made of standard components, such as engines and gear boxes, they stand amongst the select few of assembled machines which are distinctive in design.

The new 8 h.p. Ariel three-speed chain-driven sidecar machine, fitted with M.A.G. engine.

A new mount for speed men is the 8 h.p. New Imperial sporting model.

The Olympia Show—

Unit construction of engine and gear box is only one of the several excellent features embodied in this new $4\frac{1}{2}$ h.p. Beardmore-Precision.

BEARDMORE-PRECISION. (87.)

$4\frac{1}{2}$ h.p. MODEL.—89×96 mm. (597 c.c.); single-cyl. four-stroke; side-by-side valves; mechanical pump lubrication; B. and B. carb.; chain-driven mag.; 5-sp. gear; clutch and kick-starter; chain drive; 700×80 mm. tyres. Prices: Solo £105, with sidecar £135.

F. E. BAKER, LTD., King's Norton, Birmingham.—Of the Beardmore-Precision models it is difficult to determine whether the new big single or Barr and Stroud-engined machine is the more interesting. Both are magnificent engineering jobs. The $4\frac{1}{2}$ h.p. model retains the laminated spring frame, but the engine and gear box unit are entirely new. The crank case and the gear box housing are formed in one aluminium casting, although there is no actual communication between the two. A detachable cylinder head is employed, and a good feature is the provision of a large spigot for the head. Lubrication is effected by a vane pump which delivers oil to a small reservoir, whence it is fed to the crank case by a needle valve which can be readily set according to the needs of the engine. In the gear box compartment are housed the shafts and gear wheels of the Sturmey-Archer gear set, the primary drive being by a chain enclosed in an aluminium case. External contracting band brakes are fitted to both front and rear wheels. The silencing arrangements are particularly well carried out, and when the sidecar is

in position use is made of a secondary silencer carried on the sidecar chassis. Points to be noticed are the tank and frame construction and the entire absence of castings. In particular the sporting aluminium sidecars are worthy of notice

This coupé sidecar, with side "port-holes" and V windows opening as desired, is finished in primrose colour, and is a centre of attraction on the F.N. stand.

both for their attractive lines and the comfort provided.

$2\frac{3}{4}$ h.p. MODEL.—70×91 mm. (350 c.c.); single-cyl. four-stroke; sleeve valve; drip feed lubrication; Amac carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2 $\frac{1}{2}$ in. tyres. Price, solo £85.

A particularly neat sports solo mount is the model with the Barr and Stroud single-sleeve valve engine. The same

constructional features of the tank, frame, and front forks are found, but a rigid rear frame is employed. The front brake is an external contracting band, but the rear brake acts on the belt drum. This model may also be obtained with the 350 c.c. Precision two-stroke engine for £75.

3 h.p. MODEL.—74×81 mm. (350 c.c.); single-cyl. two-stroke; automatic lubrication; Amac carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain drive; 26×2 $\frac{1}{2}$ in. tyres. Price, with sidecar £105.

For the man who requires the cheapest form of conveyance for two, the sports sidecar is particularly suitable. The construction of the machine itself is identical with that of the sports solo models, but the Precision two-stroke engine-gear unit is fitted. Final transmission is by chain with a shock absorber in the rear wheel, and, in addition to the contracting front brake, a countershaft band brake, running in oil, is enclosed in the gear box and operated by a pedal on the right footboard. Footboards and legshields are formed in one and provide an ample measure of protection. The coachbuilt sidecar is light and of attractive streamline form. It is of sporting appearance and finished to harmonise with the bicycle. A feature of all Beardmore-Precision models is the very high finish obtained. A three-speed all-chain drive model with Barr and Stroud engine is offered.

A 350 c.c. Barr and Stroud single-sleeve engine, already described in detail in "The Motor Cycle," fitted to a Beardmore-Precision.

The new $4\frac{1}{2}$ h.p. Sunbeam single-cylinder sidecar engine, which has semi-circular fins at the head and vertical fins round the valve pockets.

The Olympia Show—

A complete power unit that may be fitted to any suitable existing bicycle—the Young motor attachment. The capacity of the engine is 130 c.c.

YOUNG. (77.)

1½ H.P. MODEL.—54×57 mm. (130 c.c.); single-cyl. two-stroke; petrol lubrication; W.E.C. carb.; chain-driven mag.; chain drive.

WALTHAM ENGINEERING CO., LTD., Waltham Cross, N.—A very neat power unit for pedal cycles is the Young motor attachment. A small single-cylinder two-stroke engine is mounted horizontally in a cast aluminium cradle, which also carries a chain-driven M-L magneto. An interesting point is that an aluminium cylinder is employed with a cast iron liner. A short cast aluminium exhaust pipe leads the exhaust gases to the silencer, and, as an aid to cooling, deep ribs are formed on the exhaust pipe casting. Transmission is by chain, arranged in two steps through a countershaft in which a handle-bar controlled clutch is incorporated. Various examples of the attachment are shown on both diamond and open frame cycles, and also on a tricycle. A simple but ingenious form of spring fork attachment is now produced, and should add materially to the rider's comfort.

RIDEEZI SIDECARS. (24.)

THE SIDECAR BODY CO., 25, Upper Clapton Road, S.E.5.—Nine sidecars are actually exhibited on this stand, and eight of them are different models. As among these eight, however, there are only four different chassis, it will be seen that this company goes in for specialisation to a greater extent than a first glance would indicate. In all cases the suspension is by means of two pairs of C springs fore and aft; and there is nothing unconventional in either the body or chassis design. A feature common to all the Rideezi sidecars is an enclosed wheel, but easy detachability of this model has been well provided for. The most expensive of

An attractive sidecar attachment by the Sidecar Body Co. The dickey seat is another instance of the adoption of car practice in motor cycle design.

the range, a two-seater (side-by-side), is remarkably neat, and provides exceptional locker space. This type is priced at £37, and the other models in various very striking colours vary from this figure down to £16 10s. Many sidecar components are also shown.

SUNBEAM. (121.)

3½ H.P. MODEL.—77×105 mm. (489 c.c.); single-cyl. four-stroke; side-by-side valves; pump lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch without kick-starter; chain drive; 26×2½ in. tyres. Price, solo £136 10s.

JOHN MARSTON, LTD., Wolverhampton.—The interest centred upon the Sunbeam stand is even greater than usual. This

Method adopted to obtain lower handle-bar position of the sports model Sunbeam.

is due perhaps to the introduction of two new models, of which the new T.T. type is making a strong appeal to sporting soloists. This machine has a long-stroke engine of the type which, it is expected, will be used for the 1922 T.T. races. Slightly longer in wheelbase, it is not fitted with the Sunbeam oil bath case over the rear chain, but retains it for the primary drive. An aluminium piston and light reciprocating parts help to make the engine particularly speedy. The excellent detail work is beyond reproach.

3½ H.P. MODEL.—85×88 mm. (499 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 650×65 mm. tyres. Prices: Touring £126, sports £136 10s.

Two Sunbeams with the standard type of single-cylinder engine are included in the range. The first is known as the standard model, and is intended as a dual-purpose mount, while the second is a slightly modified edition of the sports model of 1921, which was ridden to victory in the French Grand Prix, and a machine with which we have enjoyed extensive experience without an atom of trouble.

4½ H.P. MODEL.—85×105 mm. (596 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 650×65 mm. tyres. Price, solo £141 15s.

The second of the entirely new Sunbeam models is the big single, which has been developed from experience in the most important competitions of the past two years. A worthy addition, both to the Sunbeam range and to the big single sidecar class generally, this machine has a long-stroke engine with detachable head, the fins on the head forming a dome, those around the valve ports being arranged vertically. The Sunbeam oil bath cases, leaf spring forks, quickly detachable and interchangeable wheels, internal expanding rear brake, and wide mudguards form part of the specification.

8 H.P. MODEL.—85.5×88 mm. (986 c.c.); twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carburettor; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive. Price, solo £168.

Except for minor improvements, the Sunbeam big twin remains unaltered. With its oil bath cases and full touring equipment, it retains its place in the front rank of big twin sidecar outfits. The engine fitted is the new 8 h.p. J.A.P.

One of the most attractive of the many "speed" models, the 3½ h.p. T.T. Sunbeam. The engine has a considerably longer stroke than last year.

Essentially a sidecar machine—the new 4½ h.p. Sunbeam. Interchangeable wheels and oil bath chain cases are useful items.

The Olympia Show—

Driving and driven discs of the Ner-a-car friction transmission.

NER-A-CAR. (46.)

2½ h.p. MODEL.—70×70 mm. (269 c.c.); single-cyl. two-stroke; petrol lubrication; B. and B. carb.; flywheel mag.; 5-sp. gear; clutch and kick-starter; friction and chain drive; 26×2¼ in. tyres. Price, solo £69 6s.

INTER-CONTINENTAL ENG. CO., Berners Street, W.C.—A thoroughly unconventional machine, provided with a channel steel frame containing a two-stroke engine with flywheel magneto and a specially designed crank case bolted across the frame. At the rear of the flywheel there is a disc with which a friction wheel engages, carrying also the external contracting brake. The friction discs are disengaged by means of a twist grip on the left handle-bar. Final drive is by chain. There are no forks proper, but the front end of the chassis is splayed out to allow of a reasonable amount of lock, and the steering follows more or less car lines, the wheel being pivoted in the centre and supported on arms hinged to the fore ends of the chassis, and insulated from road shocks by means of coil springs. The mechanism is entirely enclosed, and an enormously wide front mudguard is fitted, which does not move with the front wheel. The machine, of course, is highly suitable for use by the fair sex, and recently a lady accomplished 1,000 miles in very bad weather on one of these machines under A.C.U. observation.

EXCELSIOR. (100.)

4½ h.p. MODEL.—86×112 mm. (650 c.c.); single-cyl. four-stroke; poppet valves; crank case suction drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×3 in. tyres. Prices: Solo £89, with sidecar £119.

BAYLISS, THOMAS, AND CO., LTD., King's Road, Tyseley, Birmingham.—An outstanding amendment in this well-

The 6 h.p. Excelsior "Popular" model, fitted with J.A.P. engine and Burman three-speed gear box.

known big single is in connection with the transmission. All-chain drive is employed, the necessary damping effect being obtained by means of two rubber block shock absorbers, one contained in the engine sprocket and the other in the rear wheel. The clutch of the Burman three-speed gear box is handle-bar-controlled, and the spacious box for tools occupies a position behind the saddle down tube.

Practically a duplicate of the 4½ h.p. single is the 6 h.p. twin, with, of course, the exception of its power unit. Also an internally expanding brake is a new feature of several of this year's Excelsior exhibits, though it has not been adopted for the single-cylinder machine. The price is £103 solo, £133 sidecar.

8 h.p. MODEL.—85.5×85 mm. (997 c.c.); twin-cyl. four-stroke; poppet valve; drip and splash feed lubrication; carb. to order; chain-driven mag.; 3-sp. gear; clutch and kick-starter; all-chain drive; 28×3 in. tyres. Prices: Solo £115, with sidecar £155.

The 8 h.p. J.A.P. *de luxe* model has many refinements, the single nut system of chain adjustment being among them. An internally expanding Ferodo-lined brake is here employed, and the model exhibited is fitted with detachable wheels and Lucas lighting set. With spare wheel, screen, and full electric equipment, including electric horn, it is priced at £195.

2¾ h.p. MODEL.—70×70 mm. (269 c.c.); single-cyl. two-stroke; drip feed lubrication; B. and B. carb.; flywheel-driven mag.; direct belt drive; 26×2¼ in. tyres. Price, solo £39 18s.

Three lightweights are on the Excelsior stand, the 2½ h.p. Villiers single-gear sporting model being typical of the

simplest form of motor cycles. The second lightweight is on the same lines, but equipped with Burman two-speed gear box and kick-starter, priced at £53. The third is a lady's model, with 2½ h.p. Villiers engine, and having a Sturmey-Archer two-speed gear box, clutch, and kick-starter. In this case 24 in. wheels are fitted, in order to obtain a low riding position.

2½ h.p. MODEL.—71×88 mm. (348 c.c.); single-cyl. four-stroke; poppet valves; drip feed lubrication; Amac carb.; chain-driven mag.; Burman 3-sp. gear; clutch and kick-starter; all-chain drive; 26×2¼ in. tyres. Price, solo £75.

A sporting little machine which will doubtless attract much attention. The frame is sloped towards the saddle, and the finish is excellent, though we are compelled to think that more generous provision in the way of ground clearance would be beneficial. To obtain this, however, the low riding position would have to be, to some extent, sacrificed.

ROYAL ENFIELD. (86.)

2½ h.p. MODEL.—64×70 mm. (225 c.c.); single-cyl. two-stroke; petrol lubrication; B. and B. carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain drive; 24×2¼ in. tyres. Price, solo £55.

THE ENFIELD CYCLE CO., LTD., Enfield Works, Redditch.—Few alterations have been made in the Royal Enfield models for 1922. As regards the lightweight, the saddle is now anchored to the top tube and to the carrier, giving a very low riding position. The neat cast aluminium footboards are provided with legshields, which, nevertheless, should not interfere with the passage of air to the cylinder. The simple but efficient selective two-speed gear with all-chain drive is, of

Semi-plan view of the frame of the Ner-a-car, a single-cylinder machine with friction gear and final chain drive.

On the sports model 2½ h.p. Excelsior the tank is held against the top tube by the pressure of two brackets screwed up from underneath.

The Olympia Show—

course, a feature of the machine, a cush drive being fitted to the rear wheel.

8 H.P. MODEL.—85.5×85 mm. (986 c.c.); twin-cyl. four-stroke; side-by-side valves; automatic lubrication; B. and B. carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain drive; 700×80 mm. tyres. Price, with sidecar £140.

As regards the 8 h.p. sidecar machine, detail alterations affecting the equipment only are to be noticed. A point of interest is the fitting of large tyres, which should not only tend to reduce running costs, but should materially enhance the driver's comfort. The power unit is, of course, built for the Royal Enfield Company by Vickers, Ltd., and, although on standard lines, is chiefly remarkable for an automatic lubrication system, by means of a mechanical pump, a hand pump being fitted in the oil tank to augment the supply of oil if necessary. Entirely new sidecar bodies have been produced, particular attention being paid to the accommodation of luggage by means of a large locker at the rear. A large tandem-seated sidecar is also shown.

VINDEC. (162.)

2½ H.P. MODEL.—66×70 mm. (239 c.c.); single-cyl. two-stroke; drip feed lubrication; Amac carb.; chain-driven mag.; 2-sp. gear, without clutch and kick-starter; chain-cum-belt drive; 26×2¼ in. tyres. Price, solo £60.

BROWN BROS., LTD., Great Eastern Street, E.C.2.—This is a sound little lightweight of good design, having several attractive features. The whole of the lower part of the unit, including the gear box, is neatly enclosed, the magneto chain cover forming part of this scheme. This renders the general appearance of the machine highly attractive. It is fitted with large footboards, wide handle-bars, and is a thoroughly practical little mount.

BLACKBURNES. (108.)

8 H.P. MODEL.—85×88 mm. (998 c.c.); twin-cyl. four-stroke; side-by-side valves; B. and L. semi-automatic drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; all-chain drive; 28×3 in. tyres. Prices: Solo 95 gns., with sidecar 125 gns.

OSBORNE ENGINEERING CO., LTD., Gosport, Hants.—The chief exhibit on the Osborne stand is a sidecar taxi having an all-steel chassis and mounted on cantilever springs. It is attached to an 8 h.p. Blackburne motor cycle, equipped with wheel steering, which gives it rather a grotesque appearance. The price of this sidecar alone, which is designed to carry three, is 150 gns., so it will hardly appeal to the ordinary tourist.

Engine and transmission of the Xtra car. Two friction wheels are alternately in contact with a drum on the rear wheel, providing two speeds.

A popular passenger outfit—the 8 h.p. Enfield; a very commodious sidecar is fitted as standard.

Other sidecars on exhibition include such interesting features as a tandem seater having an ingenious arrangement in the way of extensible and collapsible back and a sliding forward seat. All are handsomely finished and exceptionally well-sprung. No alterations have been made in the Blackburne motor cycles this year. The cylinder heads are detachable, and the power unit, most remarkable for

Wheel steering by bevel and worm is employed on the Osborne three-seater limousine sidecar model.

its hard and steady pulling at low speeds, conveys a general impression of sturdiness and good workmanship. The rear brake is internal-expanding, and the chains well protected. Screen (£5), luggage grid (£3 10s.), and spare wheel (£6 10s.) are extras.

4 H.P. MODEL.—85×88 mm. (499 c.c.); single-cyl. four-stroke; side-by-side valves; sight drip feed lubrication; Amac carb.; chain-driven mag.; Sturmey-Archer or Burman 3-sp. gear; clutch and kick-starter; all-chain drive; 26×3 in. tyres. Prices: Solo £89 5s., with sidecar £126.

Solidity of construction, which should lead to exceptional durability, is the most characteristic feature of this well-known machine. Brampton patent biffex forks and Thomson-Bennett magneto are fitted as standard, and the drive is conveyed from the Sturmey-Archer gear box by 5/8×3/4 in. open chain. Though an excellent dual-purpose machine, the 4 h.p. single is regarded by the makers as a solo mount, and brazed-lugs for sidecar attachment are not included.

XTRA CARS. (148.)

2½ H.P. MODEL.—70×76 mm. (269 c.c.); single-cyl. two-stroke; petrol lubrication; Senspray carb.; flywheel mag.; 2-sp. gear; clutch and hand starter; chain and friction drive; 26×2¼ in. tyres. Price £95.

XTRA CARS, LTD., London Road, Chertsey.—Weather protection at lightweight motor cycle running costs is the aim of this single-seated three-wheeler, which is driven by a 2½ h.p. Villiers engine. This engine drives by single chain over three sprockets, and the spindles of the driven pair carry friction wheels of different diameters. Either may be brought into engagement with the inner side of a rim attached to the rear wheel, thus giving two gear ratios and a clutch action. The further end of the frame, which is pivoted in a direct line with the engine mainshaft, is suspended on coil springs. In the front the wheel axles and pivots are suspended from the outer ends of two pairs of transverse flat springs. The engine and gear are entirely enclosed, and a hand starter is provided. The price quoted includes hood, screen, lighting equipment, and a well-filled toolkit.

The Xtra Car is propelled by a Villiers two-stroke engine, situated behind the seat, through chain and friction transmission. It is a weatherproof three-wheeler of special appeal to the business man.

The Olympia Show—

PETERS. (141.)

3½ H.P. MODEL.—76×76 mm. (347 c.c.); single-cyl. two-stroke; pressure feed lubrication; Cox carb.; flywheel mag.; variable belt gear; belt drive; 26×2½ in. tyres. Price, solo £63.

PETERS MOTORS, LTD., Ramsey, Isle of Man.—Perhaps the most completely novel machine in the Show is the Peters two-stroke, which hails from the Isle of Man. In itself, the frame is worthy of careful study, since the main frame consists of a pressed steel tank, a large diameter saddle tube (which also forms a petrol sump), and the slightly inclined engine. The head tube, enclosed within the fore part of the tank, is of very large diameter, and in its turn encloses a leaf spring attached to the forks, the latter hinging at the base of the head. The rear portion of the frame is sprung, being hinged on short links about the bottom bracket, and sprung below the saddle by two coil springs. The action of these

The Peters strikes a distinctive note both in appearance and design. The 350 c.c. two-stroke engine forms the support between the crank bracket and the under-side of the tank, displacing the usual down tube.

out to form a carrier and number plate. The machine is sold with full equipment, with lamps lit from the flywheel magneto dynamo, and a battery carried in part of the capacious steel tool box placed behind the saddle tube. The engine is of the four-port type, and is a fine piece of work. Incidentally, the bottom bracket forms the silencer.

UNIBUS. (23.)

2½ H.P. MODEL.—70×70 mm. (269 c.c.); single-cyl. two-stroke; drip feed lubrication; B. & B. carb.; chain-driven mag.; 2-sp. gear; clutch and handle starter; shaft drive; 16×2½ in. tyres.

GLOUCESTER AIRCRAFT CO., Cheltenham.

—Whatever may be said of the possibilities of the Unibus, it is quite a unique little vehicle. If we admit that the few ex-scooter miniatures at the Show form a class of themselves, then the Unibus is at the top of its class. One might even go further and say that the Unibus is in a class by itself, for it follows automobile practice on the whole more closely than anything else on two wheels. The pressed steel "chassis" with its leaf spring is excellently laid out, and final drive is by shaft and worm. The "body," if it may be called such, is of polished aluminium, and completely encloses every mechanical detail, excepting the handle starter and the controls. Cooling for the engine is provided by a wire net window in front of the steering head. The stripped chassis merits careful study.

KENILWORTH. (45.)

1½ H.P. MODEL.—55×60 mm. (142 c.c.); single-cyl. four-stroke; overhead valves; drip feed lubrication; Vic carb.; direct driven mag.; single-speed gear; clutch; belt-cum-chain drive; 16×2 in. tyres. Price, solo £48 6s.

BOOTH BROS., Coventry.—The Kenilworth miniature has now been on the market for two years. It is

fitted with a small high efficiency four-stroke engine. The drive to the countershaft is by belt, and from countershaft to rear wheel by chain, reversing the usual order, as it is held that the belt drives better at high speeds. The whole of the engine and countershaft is carried on the bottom portion of the frame, and all the mechanism is enclosed, the rider being efficiently protected from mud. The rear seat is sprung in conjunction with the footboards.

2½ H.P. MODEL.—71×88 mm. (349 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amec carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2½ in. tyres. Price, solo £68, with sidcar £90.

An entirely new machine embodying standard components is shown here. This may be described as a fairly fast light touring mount; it is well equipped with wide flat handle-bars, studded aluminium footboards, well-balanced mudguards, and a comfortable saddle. The motive power

Details of the rear suspension and worm drive of the Unibus.

springs is progressive, and the inner spring also absorbs rebound shocks by becoming a tension spring after a limited amount of travel. The variable pulley gear is operated by a lever passing through the tank, and this lever also adjusts the belt tension by shortening or extending the wheelbase. Convex pulley flanges are arranged to provide the best possible belt grip. Lubrication is effected by pressure from the cylinder, and is entirely automatic. Both brakes are on the belt rim, one internal and one external, and both are operated by light pedals. Pressed steel guards are used front and rear, the latter being splayed

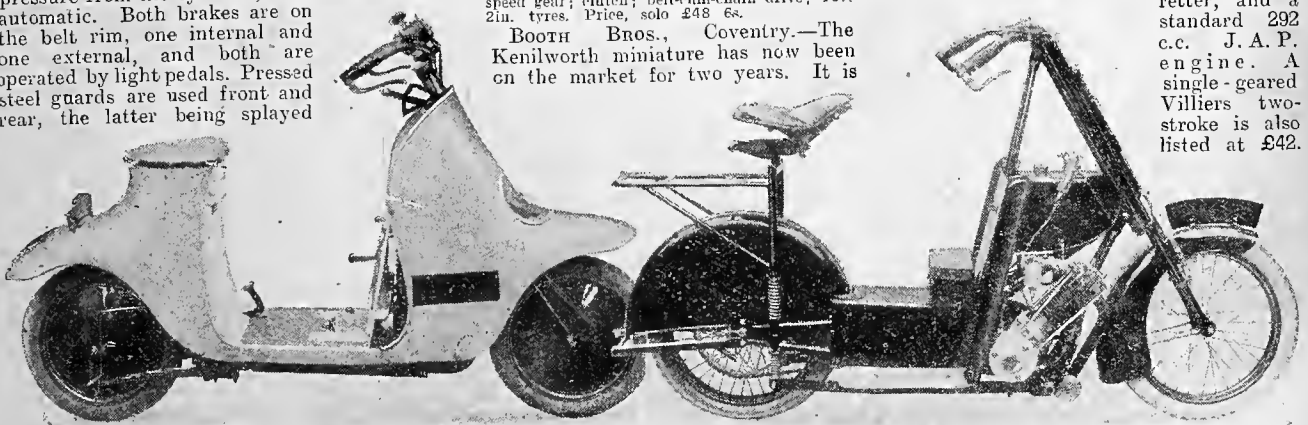

Fitted to the footrests of the sporting model Sheffield Henderson is a simple prop stand.

is the popular 2½ h.p. Blackburne, which exhausts into a small expansion chamber terminating in a large diameter long exhaust pipe, which has a standard plated finish.

2½ H.P. MODEL.—70×76 mm. (292 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; 2-sp. gear; clutch and kick starter; chain and belt drive; 26×2½ in. tyres. Price, solo £62.

This machine is practically identical with the model to which we have previously referred, except that a new type M-L magneto is fitted, a Brown and Bar-

low carburettor, and a standard 292 c.c. J.A.P. engine. A single-geared Villiers two-stroke is also listed at £42.

The novel Unibus in its latest form.

The Kenilworth miniature with overhead valve four-stroke engine.

The Olympia Show—

Front springing arrangement and mudguarding of the Jupp open frame miniature.

JUPP. (136a.)

2½ h.p. MODEL.—70×70 mm. (269 c.c.); single-cyl. two-stroke; petrol lubrication; Cox or Mills carb.; chain-driven mag.; Sturmev-Archer 2-sp. gear; clutch and hand starter; chain drive; 24×2½ in. tyres. Price, solo £78 15s.

JUPP MOTOR CO., LTD., 86, Leadenhall Street, London.—A very clever little

One of the Monopole range—the 5-6 h.p. dual-purpose mount—with J.A.P. engine and three-speed Sturmev-Archer gear.

open frame machine is the Liberty-engined Jupp. A bucket seat is provided for the rider, and this is sprung together with the rear end of the long aluminium-covered footrests. The engine is carried low down, and with the gear box and transmission is entirely shielded, so that it is impossible for the rider's coat or skirt to be soiled by contact. The rear wheel also is enclosed for half its diameter, and a very wide guard is fitted round the Brampton front forks. Instead of a kick-starter an ingenious form of hand starter is supplied, and an internal expanding brake is fitted to the

rear wheel. Leg shields are also standard fittings. Three models of this ingenious and beautifully protected little machine are shown, two being single-seated, while the third has a bucket seat mounted on coil springs fixed to the carrier by a simple and quickly detachable mounting. Amongst a number of unorthodox machines the Jupp is one of the most practical and attractive. A prop stand is part of the specification.

MONOPOLE. (122.)

5-6 h.p. MODEL.—70×88 mm. (696 c.c.); V twin-cyl. four-stroke; side-by-side valves; hand pump lubrication; B. and B. carb.; M-L chain-driven mag.; Sturmev-Archer 3-sp. gear; clutch and kick-starter; chain drive; 26×2½ in. tyres.

MONOPOLE CYCLE CO., LTD., Coventry.—This machine is in the medium twin category, and should be satisfactory both as a solo mount or for light sidecar work with an attachment such as that shown with it on the stand. A heavier specification characterises this machine, and it has wider (domed) mudguards than the light-weight models. No shock absorber is used, but the final ele-

A one piece aluminium transmission cover of neat design on the Connaught sports model.

This exhibit contains two single-cylinder machines built up of standard components; the transmission is by chain and belt. The front brake is of the rim variety, and there is a back brake acting on the back of the belt drum. Aluminium foot plates are used, and the machines, which are finished in a dark shade of green, appear to be carefully built up, without any effort at departures from standard practice. There is also a single-speed model with Villiers engine and flywheel magneto.

On the Connaught 3½ h.p. sidecar outfit the Showell pump is fitted, driven from an intermediate sprocket in the magneto drive. Observe, too, the brake pedal neatly let into the footboards.

CONNAUGHT. (98.)

3½ h.p. MODEL.—370 c.c.; single-cyl. two-stroke; Showell mechanical and petrol lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½ in. tyres. Prices: Solo £75, with sidecar £95.

BORDESLEY ENG. CO., LTD., New Bond Street, Birmingham.—An interesting lightweight sidecar outfit is a new 3½ h.p. Connaught (370 c.c.), all-chain, three-speed Burman, clutch, and kick-starter model. Both brakes operate on a special rear wheel drum. Lubrication is by petrol assisted by a visible pump feed. The same machine fitted with T.T. bars

A sporting sidecar outfit of light weight is the 2½ h.p. two-stroke Sirrah. Incidentally its sponsors claim for it the unique distinction of being the lowest-priced passenger machine in the Show,

The Verus de Luxe twin-cylinder sidecar outfit. The power unit is a 5-6 h.p. Blackburne, the gear box a Sturmev-Archer, and the chains are entirely enclosed.

The Olympia Show—

The new chain-driven 370 c.c. Connaught which is supplied with or without a sidecar.

and footrests is on exhibition as a solo mount. In this case the gear ratios are higher.

2½ h.p. MODEL.—73×70 mm. (293 c.c.); single-cyl. two-stroke; petrol lubrication; carb. to order; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain and belt drive; 24×2½ in. tyres. Prices: Solo £57 10s., 26in. wheels £2 10s. extra.

The smaller 293 c.c. model is priced at £45. It has 24in. wheels and a direct belt drive. On this year's models, the magneto control rod passes through the tank instead of being externally attached. The makers claim that a special point of the lightweight engine is its petrol consumption, which can be fairly estimated at considerably over 100 m.p.g. The same machine fitted with Burman two-speed gear box, but without clutch and kick-starter, is listed at £57 10s.

On the Connaught stand is an interesting working model cut away to reveal its interior. By an ingenious arrangement of small electric lamps, the stages of ignition, induction, and exhaust are clearly illustrated. On this year's Connaught models both brakes operate on a rear wheel drum.

JAMES. (104.)

4½ h.p. MODEL.—86×103 mm. (598 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; Sencap carb.; M-L gear-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×5½ in. tyres.

JAMES CYCLE CO., LTD., Greet, Birmingham.—Pride of place on the James stand must be given to the big single-cylinder model which has been before the public for so many years, following the same general lines with minor improvements from time to time. The engine has been improved in detail; the tappet guides are retained by a double dog held with one nut, and there is a decompressor operated by a small lever on the timing case. The engine generally is neat and the whole appearance is clean

and simple. Transmission is by chain throughout, the rear element being of the Brampton spring variety covered by a light guard. This model is shown both with touring and tradesman's delivery sidecar.

7 h.p. MODEL.—73×89.5 mm. (749 c.c.); V twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; Cox-Atmos carb.; Magdyno chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×5½ in. tyres.

This model closely follows the lines of the above-described 4½ h.p. model, but the V twin engine has completely enclosed valves and the clutch control is

Chain adjustment on the sports model James.

duplicated for hand or foot operation. Detachable and interchangeable wheels are fitted, and an extremely rigid chassis is a feature of the sidecar attached. The mounting of the sidecar

mudguard is excellent, as it is carried on an extension of the bearer bar of the body. Leg guards are fitted on the machine.

3½ h.p. MODEL.—64×77 mm. (496 c.c.); V twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; Cox-Atmos carb.; Lucas chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½ in. tyres.

There are not a large number of small V twin sports models at Olympia, but the 3½ h.p. James certainly takes a high position amongst them. As staged, it is to all intents and purposes a replica of the T.T. and Grand Prix models, and should have no difficulty in attaining 60 m.p.h. As on the large twin, the Cox carburettor is fitted vertically above the induction pipe, and the gear box is movable by a draw bolt device to facili-

One of the several miniature motor cycles appealing to ladies—the Grigg

tate chain adjustments. This model has light mudguards and footrests, wide, flat bars, and general "sports" specification.

2¼ h.p. MODEL.—66×70 mm. (239 c.c.); single-cyl. two-stroke; drip feed lubrication; Amac carb.; M-L chain-driven mag.; double chain 2-sp. gear; chain and belt drive; 26×2½ in. tyres.

In essentials the 2¼ h.p. two-stroke James remains unaltered; points worthy of notice are the triple-branched oil pipe leading to the piston and both main bearings, and the relief pipe from the compression release, which discharges below the engine. A model is listed with an ordinary two-speed gear box and all-chain drive.

GRIGG. (19.)

13½ h.p. MODEL.—57×63 mm. (161 c.c.); single-cyl. two-stroke; drip feed lubrication; Amac carb.; chain-driven mag.; Sturmer-Archer 2-sp. gear; clutch and kick-starter; chain-cup-belt drive; 24×2½ in. tyres.

GRIGG MOTOR AND ENGINEERING CO., Winchester Road, Twickenham.—For some time now the company exhibiting on this stand has specialised in a scooter, and an illuminating comparison is afforded by the staging side by side of this scooter and a new and very neat miniature motor cycle embodying exactly the same power units. The frame construction is extremely simple and embodies a minimum of costly lugs, joints being welded where possible. A pair of tubes extend straight from the rear axle lug, converging at the steering head, and the front down frame member is also duplex; the chain stays are of the normal pattern and carry a bracket for the Sturmer gear box. Footboards are fitted, and the 24in. wheels keep the machine excellently proportioned and allow a very low riding position. The tiny two-stroke engine bears evidence of careful design; for example, the cylinder ports are bridged so that the piston rings are in no danger of fouling at this point. Single-blade Druid forks are fitted.

Representative of two classes of sidecar onthts—luxury and utility. (Left) The 7 h.p. James, which now has interchangeable wheels. (Right) The big single 4½ h.p. of the same name, which follows less elaborate lines.

The Olympia Show—

HOBART. (62.)

2½ h.p. MODEL.—70×76 mm. (292 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; all-chain drive; 26×2¼ in. tyres. Prices: All-on solo £89 15s., with sidecar £108.

HOBART CYCLE CO., LTD., Coventry.—A very neat and serviceable little sidecar outfit is shown by this company. It has very full equipment, including a B.T.H. magneto, electric lighting, stands to both wheels, rubber aluminium footboards, with heel plates, and brakes to dummy

model has the same engine, but is single-gear and costs £42.

1½ h.p. MODEL.—60×60 mm. (169.6 c.c.); single-cyl. two-stroke; petrol lubrication; Amac carb.; gear-driven mag.; direct belt drive; 26×1½ in. tyres. Price, solo £27 6s.

An ultra-light 1½ h.p. Mackenzie model, making its first appearance, has an open frame suitable for either a lady or gentleman. Direct belt drive is adopted, the top run of the belt being adequately guarded. With the single gear pedals are considered necessary, but the

£69 6s. £71 8s. is charged for the chain drive model. Very complete is the solo range, which commences with a Villiers engined model selling at thirty-eight guineas.

The next in order is another single-gear mount at forty-three guineas, and has an O.K. 292 c.c. engine or Villiers as desired. With a plain two-speed, this model is fifty-three guineas, fifty-eight guineas with clutch and kick-starter, and sixty-two guineas with three-speed.

SILVER PRINCE. (31.)

2½ h.p. MODEL.—70×70 mm. (269 c.c.); single-cyl. two-stroke; mechanical pump lubrication; B. and B. carb.; flywheel mag.; Albion 2-sp. gear, without clutch and kick-starter; chain and belt drive; 26×2¼ in. tyres. Price, solo £48 6s.

TRYS CYCLE CO., Birchfields, Birmingham.—Very often when a single-geared lightweight is bought as a first mount, the purchaser desires to widen his range of action after some little experience on the road. A gear box is the obvious solution, but on the great majority of present-day machines to fit one of these is impossible without structural alteration to the bottom bracket, and usually the whole rear frame portion. Recognising this, the designer of the Silver Prince, and its more moderately priced companion machine, the Indian Prince, has made all his models easily convertible. The other point of interest on this stand is the price of the plain two-speed Indian Prince sidecar outfit, viz., £71 8s. The specification of this model is the same as that of the Silver Prince (above), excepting that lubrication is effected by a plain drip-feed and Saxon forks are substituted for Bramptons. On the Villiers-engined Silver Prince, an extension to the usual short exhaust pipe is fitted. Eleven machines are shown in all at prices from £44 2s. to £95 6s.

ECONOMIC. (143.)

1½ h.p. MODEL.—52.5×38.5 mm. (165 c.c.); flat twin-cyl. two-stroke; petrol lubrication; Capac carb.; flywheel mag.; chain drive; 26×1½ in. tyres. Price, solo £30.

ECONOMIC MOTORS, LTD., Wells Street, W.L.—An American design, the Economic attachment is now made in Great Britain. It is a flat twin two-stroke fitted with flywheel magneto, designed to be fitted over the rear of a pedal cycle and driven by means of a chain. The price quoted includes the cycle. A large sprocket is clamped round the wheel hub, and is connected to the wheel rim by three

Perhaps best known in its spring frame guise, the 2½ h.p. Hobart is quite popular in the simpler form. A Morris two-stroke engine is fitted.

belt rims on both wheels. The triangulated chassis has an extra diagonal cross stay to the member attached to the down tube of the frame. The body is mounted on semi-elliptic springs.

2½ h.p. MODEL.—70×76 mm. (292 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2¼ in. tyres. Price, solo £67 15s.

A semi-sports model is provided with the Hobart spring frame, which has four coil springs on each side. These are of different strengths and periodicity and interposed between the hinged back portion and the main frame. It is a very practical touring lightweight. The same machine, with rigid frame, is priced at £63.

2½ h.p. MODEL.—67×70 mm. (247 c.c.); single-cyl. two-stroke; drip feed lubrication; Amac carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2¼ in. tyres. Price, solo £55.

A Hobart-Morris two-stroke engine is used in this case, with chain-cum-belt drive. The equipment is practically the same as the rigid frame model previously referred to. A simplified pattern of this

machine has a good road performance. We may mention that it is identical with the mount on which W. F. Smith lately completed an A.C.U. officially observed trial from London to Exeter, referred to in another part of this issue. Altogether, the Hobart exhibit is exceptionally comprehensive, representing a miniature show in itself.

O.K. JUNIOR. (91.)

2½ h.p. MODEL.—70×76 mm. (292 c.c.); single-cyl. two-stroke; drip feed lubrication; Amac carb.; chain-driven mag.; Moss 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼ in. tyres. Price, with sidecar £96 12s.

HUMPHRIES AND DAWES, LTD., Hall Green, Birmingham.—Naturally the most interesting model on this stand is the little sidecar outfit which did so well in the A.C.U. Six Days Trial. It is a thoroughly practical little machine—a full touring outfit in miniature. Chain drive, three-speed gear and sidecar with side door and lockers are all items found in the specification of much larger machines.

A solo model with the main essentials of this machine has been added to the range, and, with three-speed gear, chain-cum-belt transmission, sells at

One of the lightest machines in the Show is the 1½ h.p. two-stroke McKenzie, with direct belt drive, which scales 75 lb.

A simple O.K. two-speed two-stroke which has many competition successes to its credit.

The Olympia Show—

springs. The Economic unit serves a variety of purposes, as is demonstrated by the firm's exhibit, while the flywheel magneto enables any one of the vehicles shown to be electrically lighted. The attachment, complete with pedal cycle but without transmission shock absorber, is sold at £25.

An Economic unit is also fitted in a lightweight motor cycle, which turns the scales at 94 lb. It has a duplex frame, early Indian type forks, chain-cum-belt drive, and tool box and carrier combined over the rear mudguard. A 3in. belt is fitted. A two-speed gear can be easily fitted at a small extra cost. Naturally on so small a mount a clutch and kick-starter are not required. Price £34; with two-speed, £37 10s.

The Economic Buckboard is an unconventional three-wheeled runabout seating two persons, the power unit of which is similar to those previously described, but the engines are specially selected and guaranteed to develop about 4 h.p. The unit is fixed to the rear of the frame, and drives by a conventional type of friction gear through a chain to the off side back wheel. There is a brake on the off side rear wheel and on the counter-shaft. This vehicle is guaranteed to take

The Economic miniature is on up-to-date lines, and embodies a tiny flat twin two-stroke engine.

are chiefly remarkable for the attractive finish, the colour scheme adopted being a bright cerise. The power unit is the Blackburne, and the transmission is by chain throughout, a three-speed Burman gear box with clutch and kick-starter being incorporated. Both brakes operate on dummy belt rims, the

A weatherproof mount—the Hagg, which embodies a unique frame construction concealed by its tank and side panels.

two passengers at a speed of 30 m.p.h., and climb a single figure gradient with two up. The chassis is composed of ash slats, which also form the springing system. The price is £60.

NEW SCALE. (85.)

2½ h.p. MODEL.—71×88 mm. (348 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amal carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½in. tyres. Prices: Solo £80, with sidecar £105.

ROBERTS AND HIBBS, Bank Street Works, Droylsden, Manchester.—On standard lines, the New Scale machines

rear brake shoe having a parallel action. A good feature is that the brake pedal, which is arranged to be heel-operated, is suitably inclined, for the driver's foot can easily and naturally slide off the footboard on to the brake pedal. This machine is eminently suitable for use as a dual-purpose mount with a light sidecar. When so used, a four-point chassis attachment is provided, and a roomy body is fitted.

This model may also be obtained as a sporting solo mount with a 2½ h.p. overhead valve Blackburne engine. In this case no kick-starter is included, and racing bars are fitted.

4½ h.p. MODEL.—85×95 mm. (548 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amal carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 650×65 mm. tyres. Prices: Solo £100, with sidecar £135.

The larger New Scale machine is primarily designed for sidecar use, but nevertheless forms an attractive solo mount. In main outline and specification it follows the smaller model, but the new type 4½ h.p. Blackburne engine is the power unit, and the Sturmey-Archer three-speed gear box is used. A good feature is the fitting of Brampton forks of the size used for 6 h.p. machines. In this case a shock absorber is incorporated in the rear wheel, and broad domed mudguards provide ample protection for the rider. The sidecar is well upholstered and sprung, and ample luggage accommodation is afforded by a locker in the bulbous back. Since the two-stroke has been discontinued, only four-stroke New Scale machines are marketed.

HAGG. (3b.)

3½ h.p. MODEL.—74×81 mm. (350 c.c.); single-cyl. two-stroke; mechanical lubrication; Cox-Atmos carb.; chain-driven mag.; 2-sp. gear; clutch and hand starter; chain-cum-belt drive; 26×2½in. tyres. Price, solo £95.

THE HAGG TANDEM MOTOR CYCLE CO., Park Street, near St. Albans.—An unconventional machine of quite original design, provided with a spring frame in which a single multi-leaf spring is employed. The mechanism is entirely enclosed, and the special shields are capable

The 4½ h.p. three-speed chain-driven New Scale—a dual purpose mount.

One of the new models at the Show is the single-cylinder Chater-Lea chain and belt driven machine illustrated. It has a 4 h.p. engine.

The Olympia Show—

of being hinged downwards so that the whole engine and transmission may be reached. The back wheel is entirely enclosed, and consequently

Another of the many two-strokes of the simplest type—the Dayton

the rider is kept clean. There is a sloping saddle tank, and a quickly detachable and adjustable seat is provided, so that the machine may be used either solo or with an extra passenger at the rear. A hand starter is provided. The main frame is remarkable for its simplicity, consisting as it does of two main tubes and a number of steel pressings.

DUNELT. (136.)

4 h.p. MODEL.—85×88 mm. (500 c.c.); single-cyl. two-stroke; drip feed lubrication; Amac carb.; M-L chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain and belt drive; 26×2½ in. tyres. Prices: Solo £86 2s., with sidecar £110 5s.

DUNFORD AND ELLIOTT (SHEFFIELD), LTD., Bath Street, Birmingham.—Unique in so far as it is the only 500 c.c. single-cylinder two-stroke on the British market, the Dunelt has nevertheless made good both in competition work and in the hands of private owners. A piston of two diameters is fitted, the larger portion being utilised to obtain a full crank case charge. With its sloping tank rails and special spring fork, the Dunelt has an imposing appearance, and that it is practical in every way we can state after prolonged experience. Very little change has taken place for 1922, but the foot-boards have been improved as regards comfort, a longer brake pedal is fitted, and for a small additional charge 28×3 in. tyres may be obtained. Both wheels of the cycle and that of the sidecar are quickly detachable and interchangeable, and provision for carrying a spare wheel is made at the rear of the capacious sidecar.

Distinctive as the biggest two-stroke single at Olympia—the 4 h.p. Dunelt.

The exhibit comprises two solo and three sidecar machines, one of the latter being fitted with a float body capable of holding two milk cans or small livestock. Belt rim brakes of the wedge pattern are fitted to both wheels, and the webbed head lug is a feature which should not be overlooked.

A Blackburne engined mediumweight, with comparatively short wheelbase—the 2½ h.p. Bown.

DAYTON. (92.)

2½ h.p. MODEL.—70×70 mm. (269 c.c.); single-cyl. two-stroke; drip feed lubrication; Amac carb.; flywheel mag.; belt drive; 26×2½ in. tyres.

CHAS. DAY MFG. CO., LTD., 221, High Street Shoreditch, E.C.1.—As a simple lightweight, the Dayton attracts much favourable comment, although it is not entirely distinctive. The power unit is the Villiers two-stroke with flywheel

lines, being provided with straight-through exhaust. Transmission is by chain and belt through a Sturmey-Archer three-speed box.

A similar machine is fitted with the 293 c.c. J.A.P. engine, and is finished in chocolate and fawn with gold lining. This machine belongs to the middle-weight order, and is fitted with an Albion two-speed gear. The mudguards are of sensible dimensions, the rear guard being cut away to admit the belt. The clutch is handle-bar-controlled, and the M-L magneto by a tank lever.

2½ h.p. MODEL.—70×70 mm. (269 c.c.); single-cyl. two-stroke; drip feed lubrication; Amac carb.; flywheel mag.; 2-sp. gear; clutch and kick-starter; chain and belt drive; 26×2½ in. tyres.

This model is in most respects identical to the Blackburne model, except that the employment of a smaller unit renders possible a general reduction in weight. The sparking plug, occupying a position in the cylinder-head, has necessitated a rather unusual design of frame tube, which is divided in order to accommodate the necessary component. The chain is shielded by means of a sheet steel case.

Fitted with the same engine, the Bownian is a graceful little machine

magneto, mounted in a simple frame having substantially webbed lugs for the head. To these lugs is bolted a pressed steel tank of circular section tapering from front to rear. The lubrication system is ingenious, as air pressure in the oil tank forces lubricant through a visible drip-feed to the crank case. Both brakes operate on the rear wheel belt drum through a heel pedal on each foot-rest. This machine is available with a simple direct belt drive, with an engine-shaft clutch, or a Sturmey-Archer two-speed gear and kick-starter. Another interesting exhibit is a three-wheel single-seater with three-speed gear box and chain-cum-belt drive, the power unit being the 4 h.p. Blackburne engine. Wheel steering is employed.

BOWN. (122.)

2½ h.p. MODEL.—71×88 mm. (348 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; chain-driven mag.; Sturmey 3-sp. gear; clutch and kick-starter; chain and belt drive; 26×2½ in. tyres.

BOWNS, LTD., Æolus Works, Summer Lane, Birmingham.—A well fitted mediumweight solo mount conforming in most respects with usual practice. A 2½ h.p. Blackburne engine is used, and large aluminium foot-plates and semi-T.T. bars form part of its equipment.

The machine is rather sporting

REFINEMENT IN SIDECAR COACHWORK.

Some Examples of
the Bodybuilders'
Art.

One of the Enfield models has a sidecar equipped for all-weather service with hood, screen, and side curtains.

A sliding scuttle, embodying a screen and locker, is a new idea adopted on Douglas sidecars.

A Milford family model has a comfortable armchair for a juvenile.

The Toronda sidecar on the Brough Superior. When not in use the hood is concealed in locker compartments.

The latest Canoelet follows French lines with turned over sides and a canoe "stern" with deck rail.

COMFORT,
CONVENIENCE,
AND ART
COMBINED.

A double "dash" and screen adopted for a tandem seater attached to a Beardmore-Precision.

The Olympia Show—

finished in chocolate and gold; a torpedo tank is slung from the top tube of the simple diamond frame. The method of tank fixing is rather unusual, as it is bolted into the frame by means of extension lugs protruding from the ends of the seamless welding. The model on exhibition is fitted with Villiers flywheel lighting set and handle-bar clutch; both brakes operate on the rear wheel.

SANDUM SIDECARS. (129.)

SANDHAM ENGINEERING Co., LTD., 336, Gray's Inn Road, W.C.1.—Finely finished coachwork is only one of the features of the Sandum display of sidecars, for the chassis construction in every case is sound and along well-tried lines. All the heavier models have the wheel supported by an enclosing member of the chassis,

A Sandum model for use with large and powerful machines. It has a duplex chassis, and there is ample locker accommodation in the body.

and only the comparatively light and cheap models employ stub axles.

Dealing with the exhibits in particular, the model attracting most attention is the new double-seater, whereon a side-by-side body is accommodated on a chassis of normal width; this is done by arranging a foot well between the longitudinal chassis members, while the seat portion is allowed a certain amount of overhang. There are also tandem two-seated models, and in the lighter class an attractive semi-sporting type having a nicely rounded front panel and pointed tail. Another item attracting great attention is the Sandum-Easting windscreen, a V fronted celluloid panel, extended to form side shields and connected to the bodywork by an apron. Sliding and swivelling fixings (slotted plates on studs) give an enormous range of positions.

HUGHES SIDECARS. (116.)

THOMAS HUGHES AND SONS, Baker Street, Sparkhill, Birmingham.—As proprietary sidecars, the Hughes products make their first public appearance at the Show, and are quite up to the standards by which even the most familiar attachments in the sidecar world are judged. A large variety of models is

A one-piece carrier, of sturdy construction, on the 8 h.p. Royal Ruby

shown, from lightweights up to the heavy and luxurious equipages suited by their duplex chassis construction to the most powerful and speediest of motor cycles.

Probably the most attractive of these sidecars is the Cruiser *de luxe* model, which has very sporting lines, yet has

The Hughes Cruiser model: a luxurious touring sidecar on sporting lines.

such refinements as hinged dash with aero type windscreen, side door, and a cast aluminium step mounted on the side members of the chassis.

In addition, there is a very light sidecar suitable for use with the smaller sports type of machine.

A side-by-side double-seated sidecar on the 8 h.p. Royal Ruby. The wide rear guard will be appreciated

ROYAL RUBY. (101.)

2½ h.p. MODEL.—74.5×80 mm. (349 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain and belt drive; 26×2¼ in. tyres. Prices: Solo £70, with side car £95.

RUBY CYCLE Co., LTD., Altrincham, near Manchester.—Their patented system of springing is the chief feature which characterises the exhibits of the Royal Ruby firm, but not the least interesting model has a rigid frame, the laminated leaf spring system being employed only for the front wheel. A substantial aluminium chain case takes the place of last year's sheet steel case. The same mount, fitted with a three-speed gear box, is exhibited as a sporting sidecar outfit, and is listed at £95.

3 h.p. MODEL.—74.5×86 mm. (375 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; carb. to order; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain and belt drive; 26×2¼ in. tyres. Price, solo £90.

This machine is sprung fore and aft, and is fitted with various refinements, including adjustable foot-plates. The Royal Ruby system of springing provides for adjustment of the spring tension to suit any given load. A machine following the same lines, but having a rigid frame, is exhibited as a sidecar outfit, priced at £105.

8 h.p. MODEL.—85.5×85 mm. (986 c.c.); twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; carb. to order; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×3 in. tyres. Price, with sidecar £185.

The standard sidecar outfit departs from the remaining exhibits in that the gear box and engine are not made by the Ruby Cycle Co. It is fitted with a Sturmey-Archer gear box and 8 h.p. J.A.P. engine. It is a luxurious machine, and is provided with ample locker space for luggage. All three wheels are sprung, car type mudguards being used throughout; leg shields and adjustable foot-plates are fitted. The laminated spring suspension of all the wheels is adjustable, and all the sliding shackle pins work in hardened steel housings. With a side-by-side two-seated sidecar of unique and interesting lines in place of the ordinary touring sidecar this machine is listed at £197.

The Olympia Show—

Of symmetrical and sturdy appearance, the 350 c.c. Mohawk, fitted with J.A.P. engine and Sturmey-Archer two-speed gear.

MOHAWK. (105.)

2½ h.p. MODEL.—70×90 mm. (348 c.c.); single-cyl. four-stroke; side-by-side valves; hand pump lubrication; B. and B. carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2¼ in. tyres.

MOHAWK CYCLE CO., LTD., 2-6, Alexandra Road, Hornsey, N.—Attractively finished in green and yellow, with gold lining, the Mohawk exhibits present a pleasing appearance. In this model the J.A.P. engine is fitted with an unusually large cast aluminium silencer, and a Sturmey-Archer gear box is employed. The machine is provided with large aluminium footplates and mudguards of car type.

An identical mount, fitted with a 293 c.c. J.A.P. engine, is staged as an alternative model.

On the C.A.M. engine oil is led to a well surrounding the cylinder spigot, whence it overflows to the piston through holes in the cylinder wall.

In most details a Villiers model is similar to that just described. It is, however, of lighter construction, having a simple diamond frame, from the slanting top tube of which the tank is suspended.

3½ h.p. MODEL.—85×88 mm. (499 c.c.); single-cyl. four-stroke; side-by-side valves; hand pump lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2¼ in. tyres.

This is a sturdily-constructed machine, and the exhibition model is fitted with a commercial side carrier. The engine is an Abingdon, and an interesting feature is that both brakes operate on the rear wheel. These are actuated by the right and left feet of the rider, one being of the external contracting type and the

other being an internal wedge. Wide mudguard valances and a Sturmey-Archer gear box are fitted.

A sidecar model is shown fitted with a 5-6 h.p. J.A.P. twin-cylinder engine.

The Brampton spring link chain is partially enclosed. Wide car type mudguards are used, and both brakes are of the wedge block type.

REX-ACME. (61.)

2½ h.p. MODEL.—67×70 mm. (247 c.c.); single-cyl. two-stroke; drip feed lubrication; Amac carb.; chain-driven mag.; 2-speed gear; clutch and kick-starter; chain-cum-belt drive; 26×2¼ in. tyres. Price, solo £55.

REX MOTOR MFG. CO., LTD., Earlsdon, Coventry.—A new model Rex-Acme is a two-stroke lightweight of sound design, embodying the Morris engine, Druid pattern forks, a heel-operated brake, and a magneto neatly stowed away behind the cylinder. It is well mudguarded and has pleasing lines. The same pattern machine may be obtained, without clutch and kick-starter, for £50, and, with single gear, at £42.

A folding dickey and hammock type of main seat are adopted on the "Plus One" sidecar.

2¼ h.p. MODEL.—70×76 mm. (293 c.c.); single-cyl. four-stroke; side-by-side valves; pump-and-drip feed lubrication; Amac carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2¼ in. tyres. Price, solo £63.

Of similar design to the two-stroke is a J.A.P. engine model as above. Its all-black finish gives it a very smart appearance, and the silencing arrangements are well carried out. The same model can be had with three-speed gear, price £65 10s.

2½ h.p. MODEL.—71×88 mm. (348 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2¼ in. tyres. Prices: Solo £69 15s., with sidecar £88.

This closely resembles the Rex-Acme just described, but is equipped with the Blackburne engine and Brampton forks.

In a more elaborate form, with all-chain drive and a three-speed gear, this model is priced at £77 5s. or, with a light sidecar, at £95 10s.

4 h.p. MODEL.—85×95 mm. (550 c.c.); single-cyl. four-stroke; side-by-side valves; pump and drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; all-chain drive; 26×2¼ in. tyres. Prices: Solo £110, with sidecar £135.

The 4 h.p. Rex-Acme has a sloping curved top tube giving a very pleasing

Two well-known names (now amalgamated) on the tank should guarantee the quality of the 4 h.p. Rex-Acme.

appearance, very wide and well valanced mudguards, and dummy belt rim brakes on both wheels. It is shown with a comfortable sidecar attached, the body being suspended on long semi-elliptic springs.

The Olympia Show—

A similar model to the above is fitted with a C.A.M. engine, which has an exceptionally heavily ribbed exhaust port. In all other respects it resembles the model to which we have previously referred. The Coventry-built C.A.M. engine is one of the features of the Show, and has a detachable head.

8 H.P. MODEL.—85.5×85 mm. (986 c.c.); V twin-cyl. four-stroke; side-by-side valves; pump-cum-drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; all-chain drive; 28×3in. tyres. Price, with sidecar £150, spare wheel £7 5s. extra.

A powerful sidecar outfit intended for heavy work, and capable of going anywhere. It has all-black finish, cast aluminium cover for the front chain, and a chain guard of the same material. The mudguarding is particularly efficient, the rear mudguards being of great width. A comfortable sidecar is provided, at the back of which is a luggage platform, and at the rear of the platform the spare wheel is fixed.

CHATER-LEA. (103.)

8 H.P. MODEL.—85.5×85 mm. (986 c.c.); twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; all-chain drive; 700×80 mm. tyres. Price, with sidecar £147.

CHATER-LEA, LTD., 74-84, Banner Street, E.C.1.—There are practically no alterations in this year's 8 h.p. models.

A stop is fitted on the 8 h.p. Chater-Lea engine-shaft clutch.

Sturdiness of construction is the chief feature of the outfit, and with its gold and black finish it at once attracts the eye. In the *de luxe* model the seat pillar is sprung, and the Lucas Magdyno is employed. Chater-Lea knock-out wheel spindles are used all round, and the spare wheel is mounted between the cycle and sidecar. Fully equipped with electric lighting set, sidecar screen, two-seater sidecars, and four wheels (all interchangeable), the price is £199.

The only V twin two-stroke on the market—the spring frame Stanger.

To allow adequate cooling of the valves, the tappet guard on the 8 h.p. Chater-Lea is now curtailed slightly.

4 H.P. MODEL.—85.5×85 mm. (493 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2½ in. tyres. Price, solo £105.

This is a sturdily constructed single-cylinder machine, which will be of interest to those who specially appreciate durability. The engine is made by the Chater-Lea firm, and this is its *début* to the public. A Sturmey-Archer gear box is used, and sidecar lugs are cast integrally with the frame. Both brakes are of the compensated rim type operating on in-

Undoubtedly the new saddle tank considerably enhances the appearance of the 5-6 h.p. Coventry Eagle—one of a fine range.

dependent drums, and the magneto and main drive are both taken direct from the crankshaft.

2½ H.P. MODEL.—70×70 mm. (269 c.c.); single-cyl. two-stroke; drip feed lubrication; B. and B. carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2½ in. tyres. Price, solo 70 gns.

Chater-Lea lightweight models conform with the usual high standard of the firm.

The *de luxe* model, which is specified above, is fitted with Chater-Lea engine, one notable feature of which is the extension of cooling fins almost to the base of the cylinder. The gear operation is through a delay action mechanism, which ensures immediate engagement.

Greater resiliency has been obtained in the spring forks by the employment of two tension springs in place of the original single double-acting spring. An intermediate model, which conforms with the preceding in every respect, except that no kick-starter is provided, is listed at sixty-four guineas. A popular model at fifty guineas is fitted with a Villiers engine and Chater-Lea two-speed gear box, without clutch and kick-starter. In this latter the original system of front fork springing is retained.

STANGER. (137.)

5 H.P. MODEL.—70×70 mm. (538 c.c.); V twin-cyl. two-stroke; drip feed lubrication; Vici carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2½ in. tyres. Prices: Solo £110, with sidecar £140.

STANGER ENGINE CO., 13, Steele Road, Tottenham, N.17.—An exceedingly interesting proposition, the Stanger is the only V twin two-stroke on the market, and is conspicuous by being designed so that the cylinders fire at an interval of 180°. The engine is shown in section, and is worthy of careful study as it is

full of attractive points. An improvement which has been introduced since we last saw this engine is the fitting of gauzes to the transfer ports. The silencer is of large dimensions, of cast aluminium, and divided into two chambers. The whole engine has been most carefully thought out, and the lubrication is highly effective. The frame has extremely pleasing lines, and the springing employed is of the laminated leaf variety controlling bell cranks which carry the axle. The machine is shown fitted with a sidecar for the first time. A rigid frame model is listed at £105 solo, £135 sidecar.

DOT. (30.)

2½ H.P. MODEL.—70×90 mm. (348 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½ in. tyres. Price, solo £100.

DOR MOTORS, Arundel St., Hulme, Manchester.—The outstanding exhibit of Dot motors is a duplex spring-framed single-cylinder machine of 2½ h.p., having all-

The Olympia Show—

chain drive through a three-speed gear box. Very unusual construction is followed in the frame, which consists of a main duplex member and a quadrilateral after member hinged on ball bearings below the gear box: coil springs are introduced between these two members at the position of the seat lug. The saddle, however, is supported on long leaf springs, which are auxiliary to the coil springs.

8 H.P. MODEL.—85.5×85 mm. (986 c.c.); V twin-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×3in. tyres. Price, solo £150.

This machine is another of the increasingly popular big twin sports models equipped with one of the new J.A.P. engines, which are deservedly embodied in many attractive layouts. The designer of the Dot machines has had great experience in the production of high-powered solo mounts, and the machine exhibited is well up to his usual standard.

2½ H.P. MODEL.—70×90 mm. (348 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch, without kick-starter; 26×2½in. tyres. Price, solo £90.

Rigid framed lightweight machines under the Dot sign are staged with the new 350 c.c. J.A.P. engines, and also with the 500 c.c. V twin and the 293 c.c. single-cylinder of the same make. Saxon forks are fitted, and a general sports specification is followed. Either all red or black finish is offered.

Sturmey gear box and 2½ h.p. Blackburne engine are the chief items in the specification of the lightweight Wolf.

**WOLF. (125.)**

4½ H.P. MODEL.—85×97 mm. (548 c.c.); single-cyl. four-stroke; side-by-side valves; hand pump lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain and belt drive; 26×2½in. tyres. Price, solo £95.

WULFRUNA ENG. CO. (1920), LTD., Wolverhampton.—There are in all seven exhibits on the Wolf stand, differing mainly as regards the power unit fitted. Chain and belt drive is fitted in each case, and the finish is well carried out in black and gold. The model specified above has a Sturmey-Archer gear and C.A.V. magneto. For 1922 Wolf models have wider mudguards and wider forks to admit of this refinement, but beyond this little change has been found necessary. A 4 h.p. J.A.P. engine may be obtained in a machine of similar specification at the price of £92 10s.

Altogether lighter and fitted with a 350 c.c. J.A.P. engine, Burman two-speed

In addition to its novel frame construction, the 4 h.p. X.L. is distinctly well mudguarded.

gear with clutch and kick-starter, the 2½ h.p. model resembles its larger brothers in main features; it is, however fitted with 26×2½in. tyres. This machine may also be fitted with a 2½ h.p. Blackburne engine, and, at the price of £75, is an attractive proposition.

2½ H.P. MODEL.—70×70 mm. (269 c.c.); single-cyl. two-stroke; pressure lubrication; Amac carb.; flywheel mag.; single speed gear; kick-starter; all-belt drive; 26×2½in. tyres. Price, solo £39 18s.

A popular model fitted with Villiers engine, a torpedo tank, and direct belt drive. The front fork is of the pivoted type with compression and rebound

is the taxi-sidecar attached to an 8 h.p. Rex-Acme. A feature of this chassis is the employment of pressed steel girder side members of great strength. The body is suspended by very long semi-elliptic springs, and altogether the production should be well up to the work for which it is designed. The coachwork in particular is of excellent quality, and provision for luggage is arranged at the rear of the body.

X.L. (3a.)

4 H.P. MODEL.—85.5×85 mm. (498 c.c.); single-cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½in. tyres.

X.L. MOTORS, LTD., 506, Ulster Chambers, 168, Regent Street, W.1.—The chief item of interest concerning the X.L. is the frame, which is somewhat unconventional. It has duplex bottom tubes, which extend from the bottom of the down tube right away to the rear axle, forming the chain stays. Handsome aluminium studded footboards with heel plates are fitted, and mudguards of great width, which are deeply valanced. The hand brake is of the internal expanding type, while the foot brake is of the external pattern, and as ample leverage is provided it should be very powerful. The gear box is mounted on a separate platform, and can be removed by taking away two drawbolts. Pressed steel forks pivoted near the top and fitted with a single coil spring are provided, while the carrier is of pressed steel, and flat steel strips are used for the mudguards. One model shown has attached to it one of the Rideezi sidecars. The weight of the machine solo is 240 lb.

springs. Both brakes are foot-operated and actuate on the rear wheel. An alternative model turned out with two-speed gear box, footrests, and chain-cum-belt is listed at £60.

WILLOWBROOK SIDECARS. (97.)

WILLOWBROOK MOTOR CO., Leicester.—This Leicester concern has established a reputation for excellent coachwork, and many well-known sidecar outfits have bodies produced by this firm. A very complete range is shown for 1922, including a new lightweight in polished aluminium with a hammock seat, and another on more conventional lines. Both are carried on a simple triangulated chassis, which should be eminently strong, although of light weight. Standard touring models suitable for more powerful machines are also shown, and of considerable interest

The descriptions of 1922 Models in this issue, as well as the lengthy Illustrated Review of ACCESSORIES, were prepared by "The Motor Cycle" staff subsequent to a personal inspection of the Olympia Exhibits.

AMONG THE ACCESSORIES

A Classified Report of the Accessory Exhibits at Olympia, Reviewing the Components and Useful Fittings shown in the Gallery and in the Annexe.

CARBURETTERS.

AMAC, LTD., Aston Cross, Birmingham (209).—A special model of interest to riders of American machines is the new Amac carburetter arranged for throttle operation by linking up with existing twist grip control mechanism. The air slide is worked by a separate wire control and the usual Amac handle-bar lever.

SUMNER, VAUGHAN, AND CO., LTD., 28-30, Victoria Street, S.W.1. (262).—On this stand the Vici carburetter is shown. It is an instrument designed to give a well-balanced mixture automatically. The adjustment is controlled by a correct setting of various jets and air orifices, which, once in order, do not require further attention or compensation for speed or temperature variations.

C. BINKS (1920), LTD., Eccles, Manchester (166).—A detail improvement to the Binks three-jet carburetter is the new main air adjustment, taking the form of a small shutter in place of the screw and slide device hitherto used. A new "mouse-trap" model has also been evolved embodying the characteristics of the well-known racing carburetter, but including also a pilot jet and throttle, so that it can be used for touring work. In addition, Binks plugs and spark gaps in several varieties are shown.

BROWN AND BARLOW, LTD., Witton, Birmingham (255).—Automatic jet control, in conjunction with the opening of the throttle, by means of a regulating needle depending from the latter, is a feature still retained in the leading B. and B. models. There are several models embodying this principle, also special two-stroke models on show.

COX CARBURETTERS, LTD., Lower Essex Street, Birmingham (197).—Shown at Olympia last year, the Cox-Atmos carburetter reappears in a new and improved form, while remaining unaltered in principle and method of operation. It has been lightened by the use of aluminium, and the float chamber now contains a

filter capable of stopping and holding, without detriment to the running of the engine, as much as one and a quarter ounce of water or foreign matter. The adjustable jet is now provided with a lock, so preventing unauthorised movement. We have used Cox-Atmos carburetters on various machines with excellent results.

Whitley chain adjuster for use with Sturmey-Archer three-speed gear box.

Mainshaft of the Coventry Chain Co.'s silent chain gear box, showing unusual form of the dog clutch teeth.

A universal chain-rivet extractor made by the Coventry Chain Co.

DEGORY NO-JET CARBURATOR Co., Moore Park Road, Fulham, S.W.6 (312).—Very high claims are made for the performance of the Degory carburetter, which is of exceedingly simple design. Some improvements have been effected, notably in simplifying the operation of the control screw which regulates the petrol orifice between the float chamber and choke tube.

C. H. PUGH, LTD., Tilton Road, Birmingham (211).—The makers of the Senspray carburetter are showing their carburetters exactly as last year, no alterations being found necessary. This carburetter is made automatic or sensitive at will.

CHAIN SPECIALISTS.

ALFRED APPELBY CHAIN CO., LTD., Tilton Road, Birmingham (212).—A display of Appleby and Atco roller chains.

BRAMPTON BROS., LTD., Oliver Street, Birmingham (191).—The principal item of interest to the private motor cyclist is the Brampton spring chain, which is now made in suitable sizes for the heaviest machines and for cycle cars.

COVENTRY CHAIN CO., LTD., Coventry (163).—In addition to the usual range of Coventry chains, including the duplex types with side-by-side rollers, a special feature here is the three-speed silent chain gear box with clutch and kick-starter; the gears are operated by sliding the intermediate main and layshaft pinions and their connecting chain bodily. This gear is the subject of the accompanying sketch.

PERRY AND CO., LTD., Tyseley, Birmingham (174).—Exhibit motor cycle chains and spring lid lubricators for motor cycle use.

HANS RENOLD, LTD., Didsbury, Manchester (194).—An exhibit of roller and inverted tooth chains suitable for all motor cycle applications.

Brampton shock-absorbing spring chain.

Sectioned sketch of the Binks spark gap

Accessories at the Show—**OIL PUMPS, TANK PARTS, AND GENERAL BRASS FITTINGS.**

C. J. ADIE AND NEPHEW, LTD., Warstone Lane, Birmingham (49), show hand and foot pumps, oil guns, mascots, and handle-bar mirrors in great variety.

BEST AND LLOYD, LTD., Handsworth, Birmingham (251).—Of Best and Lloyd, Ltd., it may be said that they made possible the application of mechanical pump

The Best mechanical oil-pump, with the new hand-pump and sight feed

oiling to almost any standard machine. The Best pump has survived two years of public testing with credit, and has been fitted to a number of machines as a standard item of equipment. A slight improvement has been made in the capacity of the pump, but in essence it remains unaltered. We have used several machines so equipped, and fitted up two of our own machines with great satisfaction. A much improved and more compact

semi-automatic (hand-operated) drip feed lubricator and pump is also introduced for the first time. Other lines are quick-grip filler caps, taps, and tank fittings. The work of Best and Lloyd, Ltd., is a by-word of accuracy and finish.

COVENTRY MOVEMENT CO., LTD., Coventry (261).—Amongst this exhibit of

Quick release filler cap by the Coventry Movement Co.

small fittings is a quickly operated filler cap, hinged to its tank collar and operated by a winged key on the top.

S. A. LAMPLUGH, LTD., Tyseley, Birmingham (228).—Another firm specialising in brass goods and tank fittings. The Lamplugh mechanical, throttle-controlled pump has frequently been described in our pages. The sidcar heater, worked by hot air from a muff surrounding the

Parts of the Lamplugh throttle-controlled oil pump.

exhaust pipe, is also a useful thing for the winter months. A small item for tuning enthusiasts is the Woodlam valve

For valve grinding: the Woodlam tool, designed to operate through the spark plug hole.

grinding tool. Also shown is a new mechanical oil pump of very simple construction, and a lighting dynamo and "switch" gear on equally straightforward lines.

W. LOWE AND CO., LTD., New Street, Aston, Birmingham (239).—Inflators, petrol squirts, oil guns, and similar brass goods are exhibited on this stand.

A. R. PRICE, LTD., Aston, Birmingham (248).—Another house exhibiting all manner of turned brasswork, inflators, grease guns, oilers, and the like; a useful gadget is the valve connector for

A solderless pipe union made by Rotherhams, of Coventry.

ROTHERHAM AND SONS, LTD., Coventry (184).—Petrol taps, tank fittings, lubricators, petrol squirts, and the like, in brass, are exhibited, as well as the Bonniksen speedometer, which is famous for its dead-beat indications.

Sight feed used to combine the Showell mechanical pump with a Best & Lloyd lubricator.

E. SHOWELL AND SONS, LTD., New Street, Birmingham (110).—Besides all the usual lines in brass tank fittings, the new Showell mechanical pump is a centre of attraction; its extreme simplicity, adaptability, and low price should result in its being installed by many motor cyclists. A full description of its

construction and operation appeared in *The Motor Cycle Show Guide* last week.

SADDLERY AND PILLION SEATS.

FRANK ASHBY AND CO., Stirchley, Birmingham (249).—To motor cyclists the chief item of interest here is the Tan-

A pillion seat with leaf springing—the Tan-pillion, by F. Ashby & Co.

pillion seat, arranged for the transport of a passenger on the carrier. Another

useful accessory is a small step mat for cycle cars.

J. B. BROOKS AND CO., LTD., Great Charles Street, Birmingham (244).—

Brooks's cantilever leaf spring saddle fitted to many 1922 machines as standard.

Brooks's saddles need no other complement is shown, including the cantilever saddle attached to the carrier by long leaf springs. There is also a varied assortment of toolbags, carrier cases, spring-on leggings, and all imaginable motor cycle equipment in which leather is used.

COLLEGE LEATHER CO., Castle Street, Northampton (231).—For machines not fitted with underscreens and leg guards, the College mudshield is a most useful device. There is also a smaller shield, protecting the lower part of the engine and the rider's feet. College foot overalls are also shown, and the Spick suede folding slippers in pocket case; the latter are useful for any traveller, and specially convenient for the motor cyclist on tour.

GOUGH AND CO., LTD., Park Road, Hockley, Birmingham (226).—A general display of saddles and toolbags. The Gough saddle is unusual in having the peak mounted on a long leaf spring.

THE LEATHERIES, LTD., Sampson Road North, Birmingham (252).—Another house exhibiting a wide range of excellently finished leather goods, also the Townshend pillion seat, which has several excellent features.

Accessories at the Show—

Long coil springs and bell crank levers control the movement of the Leatheries Townshend pillion seat

JOHN LECKIE AND CO., LTD., Walsall (82).—Although the first appearance of this firm at Olympia, the product exhib-

Showing the underframe of the XL-All saddle, made by J. Leckie and Co.

ited is by no means unknown, for it is the XL-All saddle, which most riders who like saddle comfort already appreciate. A new item which was shown is a combined saddle and pillion with tool-bag and tail lamp attached.

LYCETT SADDLE AND MOTOR ACCESSORIES CO., LTD., Bromley Street, Birmingham (183).—Lycett saddles are arranged with spring peaks and swinging spring mountings at the back, this permitting flexi-

A leaf spring supports the peak of the new Lycett pan seat.

bility without twisting the springs. Many machines in the Show are equipped with the Lycett saddle system, wherein the peak is supported by a leaf spring mounted on the top tube and the rear springs are mounted on the carrier.

MIDDLEMORES (COVENTRY), LTD., Coventry (196).—This firm shows a comprehensive production of motor cycle

Leaf and coil springing is employed on the Middlemore saddle.

saddlery, mudguards, and pillion seats. The Middlemore saddle, with combined leaf and coil springing, is an excellent design.

MIDLAND GEAR CASE CO., LTD., Bridge Street West, Birmingham (221).—Also a display of leather equipment. Some useful knee grips and inner tube cases are shown.

ALFRED ROBERTS AND SONS, LTD., Deykin Avenue, Witton, Birmingham (201).—A saddle on this stand, the Jolley, has a

rubber top which, in addition to being waterproof, gives a very flexible seat. A new model has been introduced having a pan top. We have had considerable experience with this type and have found it most comfortable.

SAXELBYS, LTD., George Street, Coventry (51).—Saxessories are the products of this firm, and a variety of pillion seats and an extra child's seat for sidecars and cycle cars are shown; in addition are some useful chain-rivet extractors.

TAN-SAD WORKS, Freeman Street, Birmingham (175).—The Tan-Sad pillion seat

is shown in a great variety of forms, all based on the standard model, with various additional accessories. A pair of footrests for clamping on the chain stays of a machine is also shown, this type being preferred by many pillion passengers in place of rests sprung with the Tan-Sad. A new motor cycle saddle, replacing the No Hurts saddle, is shown; it is greatly improved, so as to relieve the

Fixed footrests attached to chainstays in conjunction with Tan-Sad pillion seats

A Tan-Sad innovation—a seat springing device in which existing saddles can be utilised. The springs are carried on the seat-pillar.

carrier of the machine from the stresses which the former imposed; moreover, the rider's old saddle top may be fitted if desired. The saddle springs are carried on a plate fixed to the seat-pillar, but the motion of the seat is controlled by parallel links swinging from the carrier.

Leather cases for spare plugs, by A. E. Wilby, Ltd.

A. E. WILBY, LTD., Holloway Head, Birmingham (224).—A general range of leather goods, toolbags, knee grips, etc.

IGNITION AND DYNAMO EQUIPMENT.

BRITISH THOMSON-HOUSTON CO., LTD., Coventry (80).—Additional to the B.T.H. magnetos, there is, of course, the eminently successful Sparklight outfit, which has gone far to revolutionise electric lighting on two-stroke lightweights. The Sparklight is also available for four-stroke singles, the surplus spark obtained by the necessity for running at engine

speed being "distributed" to earth *via* the spark gap. An innovation in the B.T.H. range is a combined magneto-generator, in which the lighting armature is driven at camshaft speed, and in turn drives the magneto, the two components being entirely independent. The same generator is also supplied in a separate dynamo installation. Last, but not least, is the B.T.H. flywheel magneto for two-stroke engines, which has been modified so as to provide lighting current for the lamps and accumulators.

E.I.C. MAGNETOS, LTD., Sampson Road North, Birmingham (237).—One of the most interesting facts connected with the E.I.C. magnetos is that the parts of the machines exhibited are interchangeable with the firm's productions of eight years ago, no essential change in design having been necessary.

FELLOWS MAGNETO CO., LTD., Willesden, N.W.10 (114).—A range of magnetos for all types of machines, including a most compact lightweight magneto with

Comb-like pole pieces are used in the Fellows 90° magneto to distort the magnetic flux to give the necessary equal spark intensity for the unequal firing intervals

internal contact breaker operating on the face cam principle; also 90° twin magnetos, having specially designed poles for providing an equal spark at both plugs. The Fellows Co. is also showing a new motor cycle carburettor having an automatic action depending upon three jets with corresponding choke tubes.

FORWARD SPARKING PLUG CO., Summer Row, Birmingham (242).—Plugs of excellent design, belt fasteners, punches,

A single point T.T. pattern Forward plug.

Forward adjusters for engines with fixed tappets.

and steel and leather link belting, specially suitable for dynamo drives, are all exhibited; there are also some useful valve clearance adjusters for engines with plain tappets.

"THE HOUSE FOR VALUE"

POWELL & HANMER, LIMITED,
CHESTER STREET AND AVENUE ROAD, ASTON MANOR, BIRMINGHAM.

Accessories at the Show—

LODGE PLUGS, LTD., Rugby (187).—After a rather long lapse, a double-pole plug is again being shown. It is used

in connection with an ordinary plug in another part of the cylinder, so enabling two sparks to be obtained simultaneously. For engines difficult to start there is a priming plug having a hollow electrode down which petrol may be injected. Then there is the usual range of ordinary

Lodge plugs for all engines. A useful little plug gap gauge is being given away to motor cyclists who call at this stand.

LUCAS ELECTRICAL CO., LTD., Birmingham (190).—This is the electrical branch of Joseph Lucas, Ltd., which took over the productions of Thomson-Bennett Magnetos, Ltd. Exhibited are Lucas magnetos, the Magdyno sets, dynamo and plain accumulator lighting sets, and separate lamp and horn equipment. In addition are the Lucas impulse starters; invaluable for fitting to the magnetos of refractory

cycle car engines, etc. The new electric tail lamp is worthy of note, the

square type for large twins of all angles has had a twelve months' successful use; in addition, there is a new line of miniature cylindrical magnetos for motor cycle engines. The weight is low, on account of the employment of cobalt steel mag-

Compactness can scarcely be carried further in the new cobalt steel magneto lightweight M-L magneto

nets, while a face cam leaf spring contact breaker, similar to that on the Maglita, is fitted.

NORTH AND SONS, LTD., Soho Square, W.1 (256).—A method of magneto construction hitherto unused in motor cycle work is embodied in the new Watford magnetos for V twins. The armature is
